INTRODUCTION

The Microchip LAN9252 provides a design solution targeted to support next generation EtherCAT® industrial controllers. Applications which are sensitive to cost, utilize short distance PCB connections, or even extreme environmental conditions like temperature may benefit from operation without the use of a transformer. A magnetic-less design could be applied anywhere when two known fixed Ethernet devices need to communicate over a known distance.

This application note provides guidelines for connecting two Microchip Ethernet devices together without a transformer.

Note: For information on transformerless operation of the LAN9250/LAN935x, refer to the Transformerless Applications of Microchip’s LAN9250/LAN935x Ethernet Controller and Switches application note.

TYPICAL TRANSFORMER ISOLATION

To appreciate non-typical transformerless application development constraints, it is first necessary to understand physical network services and signaling, and the functions that transformers provide in typical applications.

A typical network configuration consists of a point to point connection, through a cable, between two physical layer devices. Figure 1 shows a schematic for a typical transformer interface. The transmitter and the receiver of each node are DC isolated from the network cable by 1:1 transformers.
TRANSFORMERLESS CONFIGURATION

To meet the operational requirements of non-typical transformerless network applications, physical layer component transmit and receive separation and biasing as well as high voltage DC isolation to meet the specific safety requirements of the application must be implemented.

For non-typical applications, the isolation that the transformer provides in typical configurations can be realized using non-polarized capacitors.

A typical network configuration provides the services of Auto-Negotiation, Auto-MDIX, 10 Mb/s operations and 100 Mb/s operations. Auto-Negotiation and Auto-MDIX must be disabled in a transformerless application because both ends of the link are under local control. The system designer can configure a specific speed and duplex on both devices to ensure proper communication.

The IEEE 802.3–2008 specification requires the TX and RX lines to run in differential mode. The TXP and TXN lines form a differential pair and need to be designed to 100Ω differential impedance for long distances and 50Ω differential impedance for short distances. The RXP and RXN lines also form a differential pair and need to be designed to appropriate differential impedance targets.
AUTO-NEGOTIATION

The purpose of the Auto-Negotiation function is to automatically configure the transceiver to the optimum link parameters based on the capabilities of its link partner. Auto-Negotiation is a mechanism for exchanging configuration information between two link-partners and automatically selecting the highest performance mode of operation supported by both sides. In transformerless applications, Auto-Negotiation must be disabled in the Microchip device.

Note: A lowercase "x" has been appended to the end of each PHY register name in the following sections, where "x" should be replaced with "A" or "B" for the PHY A or PHY B registers respectively. In some instances, a "1" or a "2" may be appropriate instead.

Disabling Auto-Negotiation via Registers

Auto-Negotiation can be disabled by clearing the Auto-Negotiation Enable (PHY_AN) bit of the PHY x Basic Control Register (PHY_BASIC_CONTROL_x). The transceiver will then force its speed of operation to reflect the information in the PHY x Basic Control Register (PHY_BASIC_CONTROL_x) Speed Select LSB (PHY_SPEED_SEL_LSB) and Duplex Mode (PHY_DUPLEX) bits. These bits are ignored when Auto-Negotiation is enabled.

</tbody>
</table>
HP AUTO-MDIX

HP Auto-MDIX facilitates the use of CAT-3 (10BASE-T) or CAT-5 (100BASE-TX) media UTP interconnect cable without consideration of the interface wiring scheme. If a user plugs in either a direct connect LAN cable or a cross-over patch cable, the transceiver is capable of configuring the TXPx/TXNx and RXPx/RXNx twisted pair pins for correct transceiver operation.

The internal logic of the device detects the TX and RX pins of the connecting device. Since the RX and TX line pairs are interchangeable, special PCB design considerations are needed to accommodate the symmetrical magnetics and termination of an Auto-MDIX design. For transformerless applications, it is recommended to disable HP Auto-MDIX.

**Note:** The HP Auto-MDIX feature may be useful if the TX and RX lines are accidentally swapped in the transformerless application.

LAN9252 PHY REGISTER ACCESS BY PDI

The LAN9252 PHY x registers can be accessed by the PDI via the MII Management Interface Registers, as detailed in the LAN9252 Data Sheet, DS00001909A. These registers are summarized below.

<table>
<thead>
<tr>
<th>EtherCAT® Core Address</th>

</tr>
<tr>
<td>0514-0515h</td>
<td>PHY DATA Register</td>
</tr>
</tbody>
</table>
FIGURE 3: AUTO-NEGOTIATION DISABLE VIA LAN9252 REGISTERS BY PDI

1. Scan devices to detect both LAN9252s
2. Enable PDI access to MII Management
   - Write 01h to 0517h
3. Select the PHY to change characteristics of
   - Write 01h to 0512h for PHY1
   - Write 00h to 0512h for PHY0
4. Select the Basic Control Register for that PHY
   - Write 00h to 0513h
5. Disable Auto-Negotiation and force the link speed to 100mbps/full-duplex
   - Write 2100h to 0514h-0515h
6. Enable the Write operation, MPDI control only
   - Write 0201h to 0510h-0511h
7. Enable EtherCAT access to MII Management
   - Write 00h to 0517h
8. Scan devices again
9. Both LAN9252s detected by MASTER. 4 ports are now available.
LAN9252 TRANSFORMERLESS PHY OPERATION

Per Figure 5, the transformerless PHY connection is used between the first LAN9252 (PHY1) and the second LAN9252 (PHY0). The following operations must be performed to establish a transformerless connection link:

- Disable auto-negotiation on the first LAN9252 (PHY1) and the second LAN9252 (PHY0), and force the link speed to 100Mbps full-duplex (follow procedure shown in Figure 4).
- Disable “MI Link Detection” in the MI Management Control/Status Register via EEPROM on both the first and second LAN9252 (refer to the “EEPROM Configurable Registers” in the LAN9252 Data Sheet).
- Disable “Enhanced Link Detection” in the ESC Configuration Register via EEPROM on both the first and second LAN9252 (refer to the “EEPROM Configurable Registers” in the LAN9252 Data Sheet).

Bits 8, 12, and 13 of the PHY x Basic Control Register are used to control the Auto-Negotiation, link-speed and duplex (refer to the LAN9252 Data Sheet, DS00001909A). The LAN9252 PHY x Basic Control Register can be accessed via the EtherCAT MASTER or PDI.

Note: A magnetic-less design could be applied anywhere when two fixed LAN9252 devices need to communicate over a known distance.

The following examples show how to disable auto-negotiation, MI Link Detection and Enhanced Link Detection in the EEPROM.

Auto-Negotiation Disable Example in PIC32 Code

1. In the SDK, navigate to the following folder: EVB-LAN9252-HBL_PIC32_SDK_V1.3\SSC
2. Copy and paste the SSC folder, naming one copy “SSC0” and another copy “SSC1”
3. Go to the “common” folder in each new copy
4. Open the 9252HW.c file and add the following lines of code shown in Figure 6. In Figure 6 where it says “Select PHY0”, change the data value to 0x0100 to reflect PHY1 or leave as-is for PHY0.
5. Use these new files to program the PIC32 software. Refer to the Software Quick Start Guide for more information.

**Updating the EEPROM Settings**

1. In the SDK, navigate to the following folder: \EVB-LAN9252-HBI_PIC32_SDK_V1.3\ESI files
2. Open the desired mode XML file in a text editor.
3. Change line 1508 as seen below for either PHY1 or PHY0:
   - **Original**: `<ConfigData>80E00CC8813ff0000000000800000</ConfigData>
   - **PHY1**: `<ConfigData>80E00CC8813ff00000000000000000</ConfigData>
   - **PHY0**: `<ConfigData>80E00CC8813ff00000000000000000</ConfigData>
4. These two changes will disable Enhanced Link Detection as well as MI Link Detection.
PHYSICAL CONNECTION

The transmitter output is designed to sink current into a transformer. When the transformer is not used, load resistors must be connected at each device to develop the output voltage as shown in Figure 3.

**Note:** RX pins are configured with 50 Ohm to the supply for AMDIX operation where they may be configured as TX pins. If AMDIX is disabled and RX pins are for receive mode only, then the external termination can be tied any way possible as long as there is 100 Ohm differential across the pins.

FIGURE 6: LOAD RESISTORS IN TRANSFORMERLESS APPLICATION
DISTANCE CONSIDERATIONS

Microchip recommends that both Ethernet devices have terminating resistors on each analog pin. Proper lab validation should be performed to provide optimum resistor placement using the configuration shown in Figure 4.

Cable connections over very long distances without transformers are not encouraged due to the risk for potential high voltage build-up and noise effects.

FIGURE 7: EXAMPLE CONNECTION

Note: 50 Ohm termination at each device with no AC coupling capacitance can be used for PCB traces greater than 12”, assuming both Microchip devices are sharing the same power domain within the same PCB.

Note: AC coupling capacitors are required for any board to board communications using different power domains. Due to the possible shift in power/ground domains between boards, the coupling capacitor is required to minimize DC balancing issues.

SUMMARY

Microchip Ethernet devices may be configured in non-typical transformerless network applications to transmit and receive reliably. Recommendations include the use of non-polarized capacitors for DC isolation from a network cable, with a minimum DC isolation rating which suits the individual application.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
