MCP1252/3

Low-Noise, Positive-Regulated Charge Pump

Features:
- Inductorless, Buck/Boost, DC/DC Converter
- Low Power: 80 µA (Typical)
- High Output Voltage Accuracy:
  - ±2.5% (V_OUT Fixed)
  - 120 mA Output Current
- Wide Operating Temperature Range:
  - Industrial Temperature (I): -40°C to +85°C
  - Extended Temperature (E): -40°C to +125°C
- Thermal Shutdown and Short-Circuit Protection
- Uses Small Ceramic Capacitors
- Switching Frequency:
  - MCP1252: 650 kHz
  - MCP1253: 1 MHz
- Low-Power Shutdown Mode: 0.1 µA (Typical)
- Shutdown Input Compatible with 1.8V Logic
- VIN Range: 2.0V to 5.5V
- Selectable Output Voltage (3.3V or 5.0V) or Adjustable Output Voltage
- Space-Saving, 8-Lead MSOP
- Soft-Start Circuitry to Minimize In-Rush Current
- AEC-Q100 Qualified

Applications:
- White LED Backlighting
- Color Display Bias
- Local 3V-to-5V Conversions
- Flash Memory Supply Voltage
- SIM Interface Supply for GSM Phones
- Smart Card Readers
- PCMCIA Local 5V Supplies

Description:
The MCP1252/3 are inductorless, positive-regulated charge pump DC/DC converters. The devices generate a regulated fixed (3.3V or 5.0V) or adjustable output voltage. They are specifically designed for applications requiring low noise and high efficiency and are able to deliver up to 120 mA output current. The devices allow the input voltage to be lower or higher than the output voltage, by automatically switching between buck/boost operation.

The MCP1252 has a switching frequency of 650 kHz, avoiding interference with sensitive IF bands. The MCP1253 has a switching frequency of 1 MHz and allows the use of smaller capacitors than the MCP1252, thus saving board space and cost.

Both devices feature a power-good output that can be used to detect out-of-regulation conditions. Extremely low supply current and low external parts count (three capacitors) make these devices ideal for small, battery-powered applications. A shutdown mode is also provided for further power reduction. The MCP1252 and MCP1253 feature thermal and short-circuit protection and are offered in space-saving, 8-lead, MSOP packages.

</tbody>
</table>

3.1 Open-Drain Power Good Output (PGOOD)

PGOOD is a high-impedance when the output voltage is in regulation. A logic-low is asserted when the output falls 7% (typical) below the nominal value. The PGOOD output remains low until V_OUT is within 3% (typical) of its nominal value. On start-up, this pin indicates when the output voltage reaches its final value. PGOOD is high-impedance when SHDN is low.

3.2 Regulated Output Voltage (V_OUT)

Bypass to GND with a filter capacitor.

3.3 Power Supply Input (V_IN)

It is recommended that V_IN be tied to a ceramic bypass capacitor.

3.4 Ground (GND)

It is recommended that the ground pin be tied to a ground plane for best performance.

3.5 Flying Capacitor Negative Terminal (C-)

The charge pump capacitor (flying capacitor) is used to transfer charge from the input supply to the regulated output. It is recommended that a low ESR (equivalent series resistance) capacitor be used.

3.6 Flying Capacitor Positive Terminal (C+)

The charge pump capacitor (flying capacitor) is used to transfer charge from the input supply to the regulated output. Proper orientation is imperative when using a polarized capacitor.

3.7 Shutdown Input (SHDN)

A logic-low signal applied to SHDN disables the device. A logic-high signal applied to this pin allows normal operation.

3.8 Select (SELECT) Input or Feedback (FB) Input

MCP1252-33X50, MCP1253-33X50:
SELECT: Select Input Pin.
Connect SELECT to V_IN for 3.3V fixed output. Connect SELECT to GND for a 5.0V fixed output.

MCP1252-ADJ, MCP1253-ADJ:
FB: Feedback Pin.
A resistor divider connected to this pin determines the adjustable V_OUT value (1.5V to 5.5V).
4.0 DEVICE OVERVIEW

4.1 Theory of Operation

The MCP1252 and MCP1253 family of devices employ a switched capacitor charge pump to buck or boost an input supply voltage (VIN) to a regulated output voltage. Referring to the Functional Block Diagram and Figure 4-1, the devices perform conversion and regulation in three phases. When the devices are not in shutdown mode and a steady-state condition has been reached, the three phases are continuously cycled through. The first phase transfers charge from the input to the flying capacitor (CFLY) connected to pins C+ and C-. This phase always occurs for half of the internal oscillator period. During this phase, switches S1 and S2 are closed.

Once the first phase is complete, all switches are opened and the second phase (idle phase) is entered. The device compares the internal or external feedback voltage with an internal reference. If the feedback voltage is below the regulation point, the device transitions to the third phase.

The third phase transfers energy from the flying capacitor to the output capacitor connected to VOUT and the load. If regulation is maintained, the device returns to the idle phase. If the charge transfer occurs for half the internal oscillator period, more charge is needed in the flying capacitor and the device transitions back to the first phase.

The regulation control is hysteretic, otherwise referred to as a bang-bang control. The output is regulated around a fixed reference with some hysteresis. As a result, typically 50 mV of peak-to-peak ripple will be observed at the output independent of load current. The frequency of the output ripple, however, will be influenced heavily by the load current and output capacitance. The maximum frequency that will be observed is equal to the internal oscillator frequency.

The devices automatically transition between buck or boost operation. This provides a low-cost, compact and simple solution for step-down/step-up DC/DC conversion. This is especially true for battery-operated applications that require a fixed output above or below the input.
4.2 Power Efficiency

The power efficiency, $\eta$, is determined by the mode of operation. In boost mode, the efficiency is approximately half of a linear regulator. In buck mode, the efficiency is approximately equal to that of a linear regulator. The following formulas can be used to approximate the power efficiency with any significant amount of output current. At light loads, the quiescent current of the device must be taken into consideration.

\[
\eta_{\text{BOOST}} = \frac{P_{\text{OUT}}}{P_{\text{IN}}} = \frac{V_{\text{OUT}} \times I_{\text{OUT}}}{V_{\text{IN}} \times 2 \times I_{\text{OUT}}} = \frac{V_{\text{OUT}}}{V_{\text{IN}} \times 2}
\]

\[
\eta_{\text{BUCK}} = \frac{P_{\text{OUT}}}{P_{\text{IN}}} = \frac{V_{\text{OUT}} \times I_{\text{OUT}}}{V_{\text{IN}} \times I_{\text{OUT}}} = \frac{V_{\text{OUT}}}{V_{\text{IN}}}
\]

4.3 Shutdown Mode

Driving SHDN low places the MCP1252 or MCP1253 in a low-power shutdown mode. This disables the charge pump switches, oscillator and control logic, reducing the quiescent current to 0.1 µA (typical). The PGOOD output is in a high-impedance state during shutdown.

4.4 PGOOD Output

The PGOOD output is an open-drain output that sinks current when the regulator output voltage falls below 0.93V_{\text{OUT}} (typical). The output voltage can either be fixed when the selectable output device is chosen (MCP1252-33X50, MCP1253-33X50) or adjustable from an external resistive divider when the adjustable device is chosen (MCP1252-ADJ, MCP1253-ADJ). If the regulator output voltage falls below 0.93V_{\text{OUT}} (typical) for less than 200 µsec and then recovers, glitch-immunity circuits prevent the PGOOD signal from transitioning low. A 10 kΩ to 1 MΩ pull-up resistor from PGOOD to V_{\text{OUT}} may be used to provide a logic output. Connect PGOOD to GND or leave unconnected if not used.

4.5 Soft-Start and Short-Circuit Protection

The MCP1252 and MCP1253 feature foldback short-circuit protection. This circuitry provides an internal soft-start function by limiting in-rush current during startup and also limits the output current to 200 mA (typical) if the output is shorted to GND. The internal soft-start circuitry requires approximately 300 µsec, typical with a 5V output, from either initial power-up or release from shutdown for the output voltage to be in regulation.

4.6 Thermal Shutdown

The MCP1252 and MCP1253 feature thermal shutdown with temperature hysteresis. When the die temperature exceeds 160°C, typically, the device shuts down. When the die cools by 15°C, typically, the device automatically turns back on. If high die temperature is caused by output overload and the load is not removed, the device will turn on and off, resulting in a pulse output.

5.0 APPLICATIONS

The MCP1252 and MCP1253 are inductorless, positive-regulated, charge pump DC/DC converters. A typical circuit configuration for the fixed output version is depicted in Figure 5-1. The adjustable version is depicted in Figure 5-2.
5.1 Capacitor Selection

The style and value of capacitors used with the MCP1252 and MCP1253 family of devices determine several important parameters such as output voltage ripple and charge pump strength. To minimize noise and ripple, it is recommended that low ESR (0.1 Ω) capacitors be used for both C\textsubscript{IN} and C\textsubscript{OUT}. These capacitors should be either ceramic or tantalum and should be 10 µF or higher. Aluminum capacitors are not recommended because of their high ESR.

If the source impedance to V\textsubscript{IN} is very low, up to several megahertz, C\textsubscript{IN} may not be required. Alternatively, a somewhat smaller value of C\textsubscript{IN} may be substituted for the recommended 10 µF, but will not be as effective in preventing ripple on the V\textsubscript{IN} pin.

The value of C\textsubscript{OUT} controls the amount of output voltage ripple present on V\textsubscript{OUT}. Increasing the size of C\textsubscript{OUT} will reduce output ripple at the expense of a slower turn-on time from shutdown and a higher in-rush current.

The flying capacitor (C\textsubscript{FLY}) controls the strength of the charge pump. In order to achieve the maximum rated output current (120 mA), it is necessary to have at least 1 µF of capacitance for the flying capacitor. A smaller flying capacitor delivers less charge per clock cycle to the output capacitor, resulting in lower output ripple. The output ripple is reduced at the expense of maximum output current and efficiency.

5.2 Output Voltage Setting

The MCP1252-33X50 and MCP1253-33X50 feedback controllers select between an internally-set, regulated output voltage (3.3V or 5.0V). Connect SELECT to GND for a regulated 5.0V output and connect SELECT to V\textsubscript{IN} for a regulated 3.3V output.

The MCP1252-ADJ and MCP1253-ADJ utilize an external resistor divider that allows the output voltage to be adjusted between 1.5V and 5.5V. For an adjustable output, connect a resistor between V\textsubscript{OUT} and FB (R\textsubscript{1}) and another resistor between FB and GND (R\textsubscript{2}). In the following equation, choose R\textsubscript{2} to be less than or equal to 30 kΩ and calculate R\textsubscript{1} from the following formula:

\[
EQUATION 5-1: \quad R_1 = R_2 \left[ \frac{V_{OUT} - V_{FB}}{V_{FB}} - 1 \right]
\]

and:

\[
EQUATION 5-2: \quad V_{OUT} = V_{FB} \left( 1 + \frac{R_1}{R_2} \right)
\]

Note that the tolerance of the external resistors will have an effect on the accuracy of the output voltage. For optimum results, it is recommended that the external resistors have a tolerance no larger than 1%.

5.3 Recommended Layout

The MCP1252 and MCP1253 family of devices transfer charge at high switching frequencies, producing fast, high peak, transient currents. As a result, any stray inductance in the component layout will produce unwanted noise in the system. Proper board layout techniques are required to ensure optimum performance. Figure 5-3 depicts the recommended board layout. The input capacitor connected between V\textsubscript{IN} and GND, and the output capacitor connected between V\textsubscript{OUT} and GND, are 10 µF ceramic, X7R dielectric, in 1206 packages. The flying capacitor connected between C\textsubscript{+} and C\textsubscript{-} is a 1 µF ceramic, X7R dielectric in a 0805 package. The layout is scaled 3:1.

Microchip Technology Drawing No. C04-2111A
APPENDIX A: REVISION HISTORY

Revision C (July 2014)
The following is the list of modifications:
1. Added the Extended Temperature (E) option and related information throughout the document.

Revision B (January 2013)
The following is the list of modifications:
1. Added a note to each package outline drawing.
PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Tape and Reel Option:  
- T = Tape and Reel

Output Voltage:  
- ADJ = Adjustable Voltage
- 33X50 = Selectable Voltage

Temperature Range:  
- I = -40°C to +85°C (Industrial)
- E = -40°C to +125°C (Extended) (MCP1253 only)

Package:  
- MS = Plastic Micro Small Outline (MSOP), 8-lead

Examples:

a) MCP1252-33X50I/MS: Low-Noise, Positive-Regulated Charge Pump, Fixed Output
b) MCP1252-ADJI/MS: Low-Noise, Positive-Regulated Charge Pump, Adjustable Output
c) MCP1252T-33X50I/MS: Tape and Reel, Low-Noise, Positive-Regulated Charge Pump, Fixed Output

a) MCP1253-33X50I/MS: Low-Noise, Positive-Regulated Charge Pump, Fixed Output
b) MCP1253-ADJI/MS: Low-Noise, Positive-Regulated Charge Pump, Adjustable Output
c) MCP1253T-ADJI/MS: Tape and Reel, Low-Noise, Positive-Regulated Charge Pump, Adjustable Output

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, flexPWR, JukeBlox, KEELOG, KEELOG logo, Kleer, LANCheck, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC12 logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

The Embedded Control Solutions Company and mTouch are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, ECAN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, KleerNet, KleerNet logo, MiWi, MPASM, MFP, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, RightTouch logo, REAL ICE, SQI, Serial Quad I/O, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademarks of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KeelLoq® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
