**MCP9700/9700A**  
**MCP9701/9701A**

**Features:**
- Tiny Analog Temperature Sensor
- **Available Packages:**
  - SC70-5, SOT-23-5, TO-92-3
- **Wide Temperature Measurement Range:**
  - -40°C to +125°C (Extended Temperature)  
  - -40°C to +150°C (High Temperature)  
  (MCP9700)
- **Accuracy:**
  - ±2°C (max.), 0°C to +70°C (MCP9700A/9701A)  
  - ±4°C (max.), 0°C to +70°C (MCP9700/9701)
- **Optimized for Analog-to-Digital Converters (ADCs):**
  - 10.0 mV/°C (typical) MCP9700/9700A  
  - 19.5 mV/°C (typical) MCP9701/9701A
- **Wide Operating Voltage Range:**
  - \( V_{DD} \approx 2.3V \) to 5.5V MCP9700/9700A
  - \( V_{DD} \approx 3.1V \) to 5.5V MCP9701/9701A
- **Low Operating Current:** 6 µA (typical)
- **Optimized to Drive Large Capacitive Loads**

**Typical Applications:**
- Hard Disk Drives and Other PC Peripherals  
- Entertainment Systems  
- Home Appliance  
- Office Equipment  
- Battery Packs and Portable Equipment  
- General Purpose Temperature Monitoring

**Description:**
MCP9700/9700A and MCP9701/9701A sensors with Linear Active Thermistor™ Integrated Circuit (IC) comprise a family of analog temperature sensors that convert temperature to analog voltage.

The low-cost, low-power sensors feature an accuracy of ±2°C from 0°C to +70°C (MCP9700A/9701A) and ±4°C from 0°C to +70°C (MCP9700/9701) while consuming 6 µA (typical) of operating current.

Unlike resistive sensors, e.g., thermistors, the Linear Active Thermistor IC does not require an additional signal-conditioning circuit. Therefore, the biasing circuit development overhead for thermistor solutions can be avoided by implementing this low-cost device. The Voltage Output pin (\( V_{OUT} \)) can be directly connected to the ADC input of a microcontroller. The MCP9700/9700A and MCP9701/9701A temperature coefficients are scaled to provide a 1°C/bit resolution for an 8-bit ADC with a reference voltage of 2.5V and 5V, respectively. The MCP9700/9700A output 0.1°C/bit for a 12-bit ADC with 4.096V reference.

The MCP9700/9700A and MCP9701/9701A provide a low-cost solution for applications that require measurement of a relative change of temperature. When measuring relative change in temperature from +25°C, an accuracy of ±1°C (typical) can be realized from 0°C to +70°C. This accuracy can also be achieved by applying system calibration at +25°C.

In addition, this family is immune to the effects of parasitic capacitance and can drive large capacitive loads. This provides printed circuit board (PCB) layout design flexibility by enabling the device to be remotely located from the microcontroller. Adding some capacitance at the output also helps the output transient response by reducing overshots or undershoots. However, capacitive load is not required for the stability of sensor output.

</tbody>
</table>

3.1 Power Ground Pin (GND)

GND is the system ground pin.

3.2 Output Voltage Pin (V_{OUT})

The sensor output can be measured at V_{OUT}. The voltage range over the operating temperature range for the MCP9700/9700A is 100 mV to 1.75V. The voltage range over the operating temperature range for the MCP9701/9701A is 200 mV to 3V.

3.3 Power Supply Input (V_{DD})

The operating voltage as specified in the “DC Electrical Characteristics” table is applied to V_{DD}.

3.4 No Connect Pin (NC)

This pin is not connected to the die. It can be used to improve thermal conduction to the package by connecting it to a printed circuit board (PCB) trace from the thermal source.
4.0 APPLICATIONS INFORMATION

The Linear Active Thermistor™ IC uses an internal diode to measure temperature. The diode electrical characteristics have a temperature coefficient that provides a change in voltage based on the relative ambient temperature from -40°C to 150°C. The change in voltage is scaled to a temperature coefficient of 10.0 mV/°C (typical) for the MCP9700/9700A and 19.5 mV/°C (typical) for the MCP9701/9701A. The output voltage at 0°C is also scaled to 500 mV (typical) and 400 mV (typical) for the MCP9700/9700A and MCP9701/9701A, respectively. This linear scale is described in the first-order transfer function shown in Equation 4-1 and Figure 2-16.

EQUATION 4-1: SENSOR TRANSFER FUNCTION

\[ V_{OUT} = T_C \cdot T_A + V_{0°C} \]

Where:
- \( T_A \) = Ambient Temperature
- \( V_{OUT} \) = Sensor Output Voltage
- \( V_{0°C} \) = Sensor Output Voltage at 0°C (See DC Electrical Characteristics table)
- \( T_C \) = Temperature Coefficient (See DC Electrical Characteristics table)

4.1 Improving Accuracy

The MCP9700/9700A and MCP9701/9701A accuracy can be improved by performing a system calibration at a specific temperature. For example, calibrating the system at +25°C ambient improves the measurement accuracy to ±0.5°C (typical) from 0°C to +70°C, as shown in Figure 4-2. Therefore, when measuring relative temperature change, this family measures temperature with higher accuracy.

**FIGURE 4-1:** Typical Application Circuit.

**FIGURE 4-2:** Relative Accuracy to +25°C vs. Temperature.

The change in accuracy from the calibration temperature is due to the output nonlinearity from the first-order equation, as specified in Equation 4-2. The accuracy can be further improved by compensating for the output nonlinearity.

For higher accuracy using a sensor compensation technique, refer to Application Note 1001, “IC Temperature Sensor Accuracy Compensation with a PIC® Microcontroller” (DS01001). The application note shows that if the MCP9700 is compensated in addition to room temperature calibration, the sensor accuracy can be improved to ±0.5°C (typical) accuracy over the operating temperature (Figure 4-3).

**FIGURE 4-3:** MCP9700/9700A Calibrated Sensor Accuracy.

The compensation technique provides a linear temperature reading. The application note includes compensation firmware so that a look-up table can be generated to compensate for the sensor error.

---

**FIGURE 4-1:** Typical Application Circuit.

**FIGURE 4-2:** Relative Accuracy to +25°C vs. Temperature.

The change in accuracy from the calibration temperature is due to the output nonlinearity from the first-order equation, as specified in Equation 4-2. The accuracy can be further improved by compensating for the output nonlinearity.

For higher accuracy using a sensor compensation technique, refer to Application Note 1001, “IC Temperature Sensor Accuracy Compensation with a PIC® Microcontroller” (DS01001). The application note shows that if the MCP9700 is compensated in addition to room temperature calibration, the sensor accuracy can be improved to ±0.5°C (typical) accuracy over the operating temperature (Figure 4-3).

**FIGURE 4-3:** MCP9700/9700A Calibrated Sensor Accuracy.

The compensation technique provides a linear temperature reading. The application note includes compensation firmware so that a look-up table can be generated to compensate for the sensor error.
4.2 Shutdown Using Microcontroller I/O Pin

The 6 µA (typical) low operating current of the MCP9700/9700A and MCP9701/9701A family makes it ideal for battery-powered applications. However, for applications that require a tighter current budget, this device can be powered using a microcontroller Input/Output (I/O) pin. The I/O pin can be toggled to shut down the device. In such applications, the microcontroller internal digital switching noise is emitted to the MCP9700/9700A and MCP9701/9701A as power supply noise. However, this switching noise compromises measurement accuracy – a decoupling capacitor and series resistor will be necessary to filter out the system noise.

4.3 Layout Considerations

The MCP9700/9700A and MCP9701/9701A family of sensors does not require any additional components to operate. However, it is recommended that a decoupling capacitor of 0.1 µF to 1 µF be used between the VDD and GND pins. In high-noise applications, connect the power supply voltage to the VDD pin using a 200Ω resistor with a 1 µF decoupling capacitor. A high frequency ceramic capacitor is recommended. It is necessary that the capacitor is located as close as possible to the VDD and GND pins in order to provide effective noise protection. In addition, avoid tracing digital lines in close proximity to the sensor.

4.4 Thermal Considerations

The MCP9700/9700A and MCP9701/9701A family measures temperature by monitoring the voltage of a diode located in the die. A low-impedance thermal path between the die and the PCB is provided by the pins. Therefore, the sensor effectively monitors the temperature of the PCB. However, the thermal path for the ambient air is not as efficient because the plastic device package functions as a thermal insulator from the die. This limitation applies to plastic-packaged silicon temperature sensors. If the application requires the measurement of ambient air, the TO-92 package should be considered.

The MCP9700/9700A and MCP9701/9701A sensors are designed to source/sink 100 µA (max.). The power dissipation due to the output current is relatively insignificant. The effect of the output current can be described using Equation 4-2.

\[
T_J - T_A = \theta_{JA} (V_{DD} I_{DD} + (V_{DD} - V_{OUT}) I_{OUT})
\]

Where:
- \( T_J \) = Junction Temperature
- \( T_A \) = Ambient Temperature
- \( \theta_{JA} \) = Package Thermal Resistance (331°C/W)
- \( V_{OUT} \) = Sensor Output Voltage
- \( I_{OUT} \) = Sensor Output Current
- \( I_{DD} \) = Operating Current
- \( V_{DD} \) = Operating Voltage

At \( T_A = +25°C \) (\( V_{OUT} = 0.75V \)) and maximum specification of \( I_{DD} = 12 \mu A, V_{DD} = 5.5V \) and \( I_{OUT} = +100 \mu A \), the self-heating due to power dissipation \( (T_J - T_A) \) is 0.179°C.

APPENDIX A:  REVISION HISTORY

Revision F (July 2014)
The following is the list of modifications:
1. Updated the Package Type information.
2. Note 4 in the DC Electrical Characteristics table was added.
4. Added maximum IDD specification for the High Temperature device.

Revision E (April 2009)
The following is the list of modifications:
1. Added High Temperature option throughout document.
2. Updated plots to reflect the high temperature performance.
3. Updated Package Outline drawings.
4. Updated Revision history.

Revision D (October 2007)
The following is the list of modifications:
1. Added the 3-lead SOT-23 devices to data sheet.
2. Replaced Figure 2-15.
3. Updated Package Outline Drawings.

Revision C (June 2006)
The following is the list of modifications:
1. Added the MCP9700A and MCP9701A devices to data sheet.
2. Added TO92 package for the MCP9700/MCP9701.

Revision B (October 2005)
The following is the list of modifications:
1. Added Section 3.0 “Pin Descriptions”.
2. Added the Linear Active Thermistor™ IC trademark.
3. Removed the 2nd order temperature equation and the temperature coefficient histogram.
4. Added a reference to AN1001 and corresponding verbiage.
5. Added Figure 4-2 and corresponding verbiage.

Revision A (November 2005)
• Original Release of this Document.
# MCP9700/9700A and MCP9701/9701A

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

### Examples:

- **a)** MCP9700T-E/LT: Linear Active Thermistor™ IC, Tape and Reel, 5LD SC70 package.
- **b)** MCP9700-E/TO: Linear Active Thermistor IC, 3LD TO-92 package.
- **c)** MCP9700T-E/TT: Linear Active Thermistor IC, Tape and Reel, 3LD SOT-23 package.
- **d)** MCP9700T-H/LT: Linear Active Thermistor IC, Tape and Reel, High Temperature, 5LD SC70 package.

- **a)** MCP9700AT-E/LT: Linear Active Thermistor IC, Tape and Reel, 5LD SC70 package.
- **b)** MCP9700AT-E/TO: Linear Active Thermistor IC, Tape and Reel, 3LD TO-92 package.
- **c)** MCP9700AT-E/TT: Linear Active Thermistor IC, Tape and Reel, 3LD SOT-23 package.

- **a)** MCP9701T-E/LT: Linear Active Thermistor IC, Tape and Reel, 5LD SC70 package.
- **b)** MCP9701-E/TO: Linear Active Thermistor IC, 3LD TO-92 package.
- **c)** MCP9701T-E/TT: Linear Active Thermistor IC, Tape and Reel, 3LD SOT-23 package.

- **a)** MCP9701AT-E/LT: Linear Active Thermistor IC, Tape and Reel, 5LD SC70 package.
- **b)** MCP9701A-E/TO: Linear Active Thermistor IC, 3LD TO-92 package.
- **c)** MCP9701AT-E/TT: Linear Active Thermistor IC, Tape and Reel,
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks
The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, flexPWR, JukeBlox, KEELoo, KEELoo logo, Kleer, LANCheck, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC®2™ logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

The Embedded Control Solutions Company and mTouch are registered trademarks of Microchip Technology Incorporated in the U.S.A.

QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV — ISO/TS 16949 —

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEXLOK® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
