Note 1: 100 kHz for Vcc < 2.5V

Features:

- Preprogrammed 32-Bit Serial Number:
  - Unique across all UID-family EEPROMs
  - Scalable to 48-bit, 64-bit, 128-bit, 256-bit, and other lengths
- Single Supply with Operation Down to 1.7V
- Low-Power CMOS Technology:
  - Read current 1 mA, max.
  - Standby current 1 μA, max.
- 2-Wire Serial Interface, I^2C™ Compatible
- Schmitt Trigger Inputs for Noise Suppression
- Output Slope Control to Eliminate Ground Bounce
- 100 kHz and 400 kHz Clock Compatibility
- Page Write Time 3 ms, typical
- Self-Timed Erase/Write Cycle
- Page Write Buffer:
  - 8-byte page (24AA02UID)
  - 16-byte page (24AA025UID)
- ESD Protection > 4.000V
- More than 1 Million Erase/Write Cycles
- Data Retention > 200 Years
- Factory Programming Available
- Available Packages:
  - 8-lead PDIP, 8-lead SOIC, and 5-lead SOT-23 (24AA02UID)
  - 8-lead PDIP, 8-lead SOIC, and 6-lead SOT-23 (24AA025UID)
- RoHS Compliant
- Temperature Ranges:
  - Industrial (I): -40°C to +85°C

Description:

The Microchip Technology Inc. 24AA02UID/24AA025UID (24AA02XUID*) is a 2 Kbit Electrically Erasable PROM with a preprogrammed, 32-bit unique ID. The device is organized as two blocks of 128 x 8-bit memory with a 2-wire serial interface. Low-voltage design permits operation down to 1.7V, with maximum standby and active currents of only 1 μA and 1 mA, respectively. The 24AA02XUID also has a page write capability for up to eight bytes of data (16 bytes on the 24AA025UID). The 24AA02XUID is available in the standard 8-pin PDIP, 8-pin SOIC, 5-lead SOT-23, and 6-lead SOT-23 packages.

**Note 1:** Not 100% tested. Cb = total capacitance of one bus line in pF.

**Note 2:** As a transmitter, the device must provide an internal minimum delay time to bridge the undefined region (minimum 300 ns) of the falling edge of SCL to avoid unintended generation of Start or Stop conditions.

**Note 3:** The combined TSP and VHYS specifications are due to new Schmitt Trigger inputs which provide improved noise spike suppression. This eliminates the need for a T1 specification for standard operation.

**Note 4:** This parameter is not tested but ensured by characterization. For endurance estimates in a specific application, please consult the Total Endurance™ Model which can be obtained from Microchip’s web site at [www.microchip.com](http://www.microchip.com).

Note 1: Chip address inputs A0, A1 and A2 are not connected on the 24AA02UID.

2.1 Serial Address/Data Input/Output (SDA)

SDA is a bidirectional pin used to transfer addresses and data into and out of the device. Since it is an open-drain terminal, the SDA bus requires a pull-up resistor to VCC (typical 10 kΩ for 100 kHz, 2 kΩ for 400 kHz).

For normal data transfer, SDA is allowed to change only during SCL low. Changes during SCL high are reserved for indicating Start and Stop conditions.

2.2 Serial Clock (SCL)

The SCL input is used to synchronize the data transfer to and from the device.

2.3 A0, A1, A2 Chip Address Inputs

The A0, A1 and A2 pins are not used by the 24AA02UID. They may be left floating or tied to either VSS or VCC.

For the 24AA025UID, the levels on the A0, A1 and A2 inputs are compared with the corresponding bits in the slave address. The chip is selected if the compare is true. For the 6-lead SOT-23 package, pin A2 is not connected and its corresponding bit in the slave address should always be set to ‘0’.

Up to eight 24AA025UID devices (four for the SOT-23 package) may be connected to the same bus by using different Chip Select bit combinations. These inputs must be connected to either VSS or VCC.
3.0 FUNCTIONAL DESCRIPTION

The 24AA02XUID supports a bidirectional, 2-wire bus and data transmission protocol. A device that sends data onto the bus is defined as transmitter, while a device receiving data is defined as a receiver. The bus has to be controlled by a master device which generates the Serial Clock (SCL), controls the bus access and generates the Start and Stop conditions, while the 24AA02XUID works as slave. Both master and slave can operate as transmitter or receiver, but the master device determines which mode is activated.

4.0 BUS CHARACTERISTICS

The following bus protocol has been defined:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is high. Changes in the data line while the clock line is high will be interpreted as a Start or Stop condition.

Accordingly, the following bus conditions have been defined (Figure 4-1).

4.1 Bus Not Busy (A)

Both data and clock lines remain high.

4.2 Start Data Transfer (B)

A high-to-low transition of the SDA line while the clock (SCL) is high determines a Start condition. All commands must be preceded by a Start condition.

4.3 Stop Data Transfer (C)

A low-to-high transition of the SDA line while the clock (SCL) is high determines a Stop condition. All operations must be ended with a Stop condition.

4.4 Data Valid (D)

The state of the data line represents valid data when, after a Start condition, the data line is stable for the duration of the high period of the clock signal.

The data on the line must be changed during the low period of the clock signal. There is one clock pulse per bit of data.

Each data transfer is initiated with a Start condition and terminated with a Stop condition. The number of data bytes transferred between Start and Stop conditions is determined by the master device and is, theoretically, unlimited (although only the last sixteen will be stored when doing a write operation). When an overwrite does occur, it will replace data in a first-in first-out (FIFO) fashion.

4.5 Acknowledge

Each receiving device, when addressed, is obliged to generate an acknowledge after the reception of each byte. The master device must generate an extra clock pulse which is associated with this Acknowledge bit.

Note: The 24AA02XUID does not generate any Acknowledge bits if an internal programming cycle is in progress.

The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable-low during the high period of the acknowledge related clock pulse. Of course, setup and hold times must be taken into account. During reads, a master must signal an end of data to the slave by not generating an Acknowledge bit on the last byte that has been clocked out of the slave. In this case, the slave (24AA02XUID) will leave the data line high to enable the master to generate the Stop condition.

FIGURE 4-1: DATA TRANSFER SEQUENCE ON THE SERIAL BUS
5.0 DEVICE ADDRESSING

A control byte is the first byte received following the Start condition from the master device. The control byte consists of a 4-bit control code. For the 24AA02XUID, this is set as '1010' binary for read and write operations. For the 24AA02UID the next three bits of the control byte are "don’t cares".

For the 24AA025UID, the next three bits of the control byte are the Chip Select bits (A2, A1, A0). The Chip Select bits allow the use of up to eight 24AA025UID devices on the same bus and are used to select which device is accessed. The Chip Select bits in the control byte must correspond to the logic levels on the corresponding A2, A1 and A0 pins for the device to respond. These bits are in effect the three Most Significant bits of the word address.

For the 6-pin SOT-23 package, the A2 address pin is not available. During device addressing, the A2 Chip Select bit should be set to '0'.

The last bit of the control byte defines the operation to be performed. When set to '1', a read operation is selected. When set to '0', a write operation is selected. Following the Start condition, the 24AA02XUID monitors the SDA bus, checking the device type identifier being transmitted and, upon a '1010' code, the slave device outputs an Acknowledge signal on the SDA line. Depending on the state of the R/W bit, the 24AA02XUID will select a read or write operation.

5.1 Contiguous Addressing Across Multiple Devices

The Chip Select bits A2, A1 and A0 can be used to expand the contiguous address space for up to 16K bits by adding up to eight 24AA025UID devices on the same bus. In this case, software can use A0 of the control byte as address bit A8, A1 as address bit A9 and A2 as address bit A10. It is not possible to sequentially read across device boundaries.

For the SOT-23 package, up to four 24AA025UID devices can be added for up to 8K bits of address space. In this case, software can use A0 of the control byte as address bit A8, and A1 as address bit A9. It is not possible to sequentially read across device boundaries.

Note: * Bits A0, A1 and A2 are “don’t cares” for the 24AA02UID.
6.0 WRITE OPERATION

6.1 Byte Write

Following the Start condition from the master, the device code (4 bits), the chip address (3 bits) and the R/W bit which is a logic-low, is placed onto the bus by the master transmitter. This indicates to the addressed slave receiver that a byte with a word address will follow once it has generated an Acknowledge bit during the ninth clock cycle. Therefore, the next byte transmitted by the master is the word address and will be written into the Address Pointer of the 24AA02XUID. After receiving another Acknowledge signal from the 24AA02XUID, the master device will transmit the data word to be written into the addressed memory location. The 24AA02XUID acknowledges again and the master generates a Stop condition. This initiates the internal write cycle and, during this time, the 24AA02XUID will not generate Acknowledge signals (Figure 6-1).

6.2 Page Write

The write-control byte, word address and the first data byte are transmitted to the 24AA02XUID in the same way as in a byte write. However, instead of generating a Stop condition, the master transmits up to eight data bytes to the 24AA02XUID, which are temporarily stored in the on-chip page buffer and will be written into memory once the master has transmitted a Stop condition. Upon receipt of each word, the three lower-order Address Pointer bits (four for the 24AA025UID) are internally incremented by ‘1’. The higher-order five bits (four for the 24AA025UID) of the word address remain constant. If the master should transmit more than eight words (16 for the 24AA025UID) prior to generating the Stop condition, the address counter will roll over and the previously received data will be overwritten. As with the byte write operation, once the Stop condition is received an internal write cycle will begin (Figure 6-2).

Note: Page write operations are limited to writing bytes within a single physical page regardless of the number of bytes actually being written. Physical page boundaries start at addresses that are integer multiples of the page buffer size (or ‘page size’) and end at addresses that are integer multiples of [page size – 1]. If a page Write command attempts to write across a physical page boundary, the result is that the data wraps around to the beginning of the current page (overwriting data previously stored there), instead of being written to the next page, as might be expected. It is therefore necessary for the application software to prevent page write operations that would attempt to cross a page boundary.

6.3 Write Protection

The upper half of the array (80h-FFh) is permanently write-protected. Write operations to this address range are inhibited. Read operations are not affected. The remaining half of the array (00h-7Fh) can be written to and read from normally.

7.0 ACKNOWLEDGE POLLING

Since the device will not acknowledge during a write cycle, this can be used to determine when the cycle is complete (this feature can be used to maximize bus throughput). Once the Stop condition for a Write command has been issued from the master, the device initiates the internally-timed write cycle and ACK polling can then be initiated immediately. This involves the master sending a Start condition followed by the control byte for a Write command \((R/W = 0)\). If the device is still busy with the write cycle, no ACK will be returned. If the cycle is complete, the device will return the ACK and the master can then proceed with the next Read or Write command. See Figure 7-1 for a flow diagram of this operation.

**FIGURE 7-1: ACKNOWLEDGE POLLING FLOW**

- Send Write Command
- Send Stop Condition to Initiate Write Cycle
- Send Start
- Send Control Byte with \(R/W = 0\)
- Did Device Acknowledge (ACK = 0)?
  - Yes
  - No
- Next Operation
8.0 READ OPERATION

Read operations are initiated in the same way as write operations, with the exception that the R/W bit of the slave address is set to ‘1’. There are three basic types of read operations: current address read, random read and sequential read.

8.1 Current Address Read

The 24AA02XUID contains an address counter that maintains the address of the last word accessed, internally incremented by ‘1’. Therefore, if the previous access (either a read or write operation) was to address \( n \), the next current address read operation would access data from address \( n + 1 \). Upon receipt of the slave address with R/W bit set to ‘1’, the 24AA02XUID issues an acknowledge and transmits the 8-bit data word. The master will not acknowledge the transfer, but does generate a Stop condition, and the 24AA02XUID discontinues transmission (Figure 8-1).

8.2 Random Read

Random read operations allow the master to access any memory location in a random manner. To perform this type of read operation, the word address must first be set. This is accomplished by sending the word address to the 24AA02XUID as part of a write operation. Once the word address is sent, the master generates a Start condition following the acknowledge. This terminates the write operation, but not before the internal Address Pointer is set. The master then issues the control byte again, but with the R/W bit set to a ‘1’. The 24AA02XUID will then issue an acknowledge and transmit the 8-bit data word. The master will not acknowledge the transfer, but does generate a Stop condition, and the 24AA02XUID will discontinue transmission (Figure 8-2).

8.3 Sequential Read

Sequential reads are initiated in the same way as a random read, except that once the 24AA02XUID transmits the first data byte, the master issues an acknowledge as opposed to a Stop condition in a random read. This directs the 24AA02XUID to transmit the next sequentially-addressed 8-bit word (Figure 8-3).

To provide sequential reads, the 24AA02XUID contains an internal Address Pointer that is incremented by one upon completion of each operation. This Address Pointer allows the entire memory contents to be serially read during one operation.

8.4 Noise Protection

The 24AA02XUID employs a Vcc threshold detector circuit which disables the internal erase/write logic if the Vcc is below 1.5V at nominal conditions.

The SCL and SDA inputs have Schmitt Trigger and filter circuits which suppress noise spikes to assure proper device operation, even on a noisy bus.

- **ACK**

- **NO ACK**

**Note:** * Bits A0, A1 and A2 are “don’t cares” for the 24AA02UID.
FIGURE 8-2: RANDOM READ

FIGURE 8-3: SEQUENTIAL READ

Note: * Bits A0, A1 and A2 are “don’t cares” for the 24AA02UID.
9.0 PREPROGRAMMED UNIQUE 32-BIT SERIAL NUMBER

The 24AA02XUID is programmed at the factory with a unique 32-bit serial number stored in the upper half of the array and permanently write-protected. The remaining 1,024 bits are available for application use.

| Note: | The 32-bit serial number is unique across all Microchip UID-family serial EEPROM devices. |

FIGURE 9-1: MEMORY ORGANIZATION

The 4-byte serial number is stored in array locations 0xFC through 0xFF, as shown in Figure 9-2.

9.1 Manufacturer and Device Codes

In addition to the serial number, a manufacturer code is stored at location 0xFA and a device identifier is stored at 0xFB. The manufacturer code is fixed as 0x29. For the 24AA02XUID, the device identifier is 0x41. The '4' indicates the I²C™ family and the '1' indicates a 2 Kbit memory density.

FIGURE 9-2: SERIAL NUMBER PHYSICAL MEMORY MAP EXAMPLE

9.2 Extending the 32-bit Serial Number

For applications that require serial numbers larger than 32 bits, additional data bytes can be used to pad the provided serial number to meet the required length. Any data byte values can be used for padding as the 32-bit serial number ensures the extended serial number remains unique.

The padding can be performed in two ways. The first method is to pad the data in software by combining the 32-bit serial number from the 24AA02XUID with fixed data. The second method is to extend the number of bytes read from the 24AA02XUID to meet the required length. Table 9-1 shows example address ranges and their corresponding serial number lengths.

TABLE 9-1: EXTENDED READ EXAMPLES

</tr>
</tbody>
</table>

Note: NN = Alphanumeric traceability code
**Legend:**

XX...X  Part number or part number code

T    Temperature (I, E)

Y    Year code (last digit of calendar year)

YY    Year code (last 2 digits of calendar year)

WW    Week code (week of January 1 is week ‘01’)

NNN    Alphanumeric traceability code (2 characters for small packages)

e3    Pb-free JEDEC designator for Matte Tin (Sn)

**Note:**

For very small packages with no room for the Pb-free JEDEC designator e3, the marking will only appear on the outer carton or reel label.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

*Standard OTP marking consists of Microchip part number, year code, week code, and traceability code.*

Microchip Technology Drawing No. C04-2028A
APPENDIX A:  REVISION HISTORY

Revision A (05/13)
Initial release.
THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

• **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user’s guides and hardware support documents, latest software releases and archived software
• **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
• **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip’s customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

• Distributor or Representative
• Local Sales Office
• Field Application Engineer (FAE)
• Technical Support
• Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com
READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

To: Technical Publications Manager
RE: Reader Response

From: Name ____________________________

Company ______________________________
Address ________________________________
City / State / ZIP / Country _______________

Telephone: (______) _________ - _________
FAX: (_____ ) _________ - _________

Application (optional): __________________

Would you like a reply? Y N

Device: 24AA02UID/24AA025UID

Questions:
1. What are the best features of this document? ____________________________________________

2. How does this document meet your hardware and software development needs? __________

3. Do you find the organization of this document easy to follow? If not, why? 

4. What additions to the document do you think would enhance the structure and subject? 

5. What deletions from the document could be made without affecting the overall usefulness? 

6. Is there any incorrect or misleading information (what and where)? __________________________

7. How would you improve this document? _______________________________________________
PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

**Device:**

- **24AA02UID** = 1.7V, 2 Kbit \(^2^C\) Serial EEPROM with 32-bit Serial Number
- **24AA02UIDT** = 1.7V, 2 Kbit \(^2^C\) Serial EEPROM with 32-bit Serial Number (Tape and Reel)
- **24AA025UID** = 1.7V, 2 Kbit \(^2^C\) Serial EEPROM with 32-bit Serial Number and Address Pins
- **24AA025UIDT** = 1.7V, 2 Kbit \(^2^C\) Serial EEPROM with 32-bit Serial Number and Address Pins (Tape and Reel)

**Temperature Range:**

- I = -40°C to +85°C

**Package:**

- P = Plastic DIP (300 mil body), 8-lead
- SN = Plastic SOIC (3.90 mm body), 8-lead
- OT = SOT-23 (Tape and Reel only)

**Examples:**

a) **24AA02UID-I/SN:** 2k-bit, 8-byte page, Serial EEPROM with 32-bit Serial Number, Industrial Temperature, 1.7V, SOIC package
b) **24AA02UIDT-I/OT:** 2k-bit, 8-byte page, Serial EEPROM with 32-bit Serial Number, Industrial Temperature, 1.7V, SOT-23 package, tape and reel
c) **24AA025UID-I/SN:** 2k-bit, 16-byte page, Serial EEPROM with 32-bit Serial Number, Industrial Temperature, 1.7V, Cascadable, SOIC package
d) **24AA025UID-I/P:** 2k-bit, 16-byte page, Serial EEPROM with 32-bit Serial Number, Industrial Temperature, 1.7V, Cascadable, PDIP package
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV
ISO/TS 16949

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
