Features

- Automotive AEC-Q100 Qualified, PPAP available upon request
- Position Sensorless BLDC Drivers (no Hall Sensor required)
- 180° Sinusoidal Drive for High Efficiency and Low Acoustic Noise
- Supports 2V to 14V Power Supplies
- Speed Control through Power Supply Modulation (PSM) and/or Pulse-Width Modulation (PWM)
- Built-In Frequency Generator (FG output signal)
- Built-In Lock-Up Protection and Automatic Recovery Circuit (external capacitor not necessary)
- Built-In Overcurrent Limitation (1.5A)
- Built-In Overvoltage Protection
- Built-In Thermal Shutdown Protection
- Thermally Enhanced 8-Lead 4 mm x 4 mm DFN Package with Exposed Pad
- 23 kHz PWM Output Frequency
- No External Tuning Required
- Optimized for Fan Cooling Systems

Typical Applications

- Silent Notebook CPU/GPU Cooling Fans
- Air Ventilation System
- 12V 3-Phase BLDC Motors

Description

The MCP8063 device is a highly integrated 3-phase, full-wave sensorless driver for brushless motors. It features a 180° sinusoidal drive, high torque output, and silent drive. Its integrated features and the wide power supply range (2V to 14V) make the MCP8063 an ideal candidate for a broad range of motor characteristics, requiring no external tuning. Speed control can be achieved through either power supply modulation (PSM) or pulse-width modulation (PWM).

Due to the compact packaging and minimum bill of materials (power transistors integrated, no Hall sensor, no external tuning), the MCP8063 is optimized for fan applications that require high efficiency and low acoustic noise at competitive costs. Frequency generator output enables precision speed control in closed-loop applications. The MCP8063 driver includes a Lock-Up Protection mode, which turns off the output current when the motor is under lock condition, and an automatic recovery that enables the fan to restart when the lock condition is removed. Features such as motor overcurrent limitation and thermal shutdown protection improve motor system reliability without additional efforts from design engineers.

The MCP8063 is available in a compact thermally-enhanced 8-lead 4 mm x 4 mm DFN package with exposed pad.

4.0 FUNCTIONAL DESCRIPTION

The MCP8063 device generates a full-wave signal to drive a 3-phase sensorless BLDC motor. High efficiency and low power consumption are achieved due to DMOS transistors and synchronous rectification drive type. The current carrying order of the output is as follows: OUT1 → OUT2 → OUT3.

4.1 Speed Control

The rotational speed of the motor can be controlled either through the PWM digital input signal or by varying the power supply (VDD). When the PWM signal is “High” (or left open), the motor rotates at full speed. When the PWM signal is “Low”, the motor is stopped (and the driver outputs are set to high impedance). By changing the PWM duty cycle, the speed can be adjusted. Notice that the PWM frequency has no special meaning for the motor speed and is asynchronous with the activation of the output transistors. Thus, the user has maximum freedom to choose the PWM system frequency within a wide range (from 20 Hz to 100 kHz), while the output transistor activation always occurs at a fixed rate, which is outside the range of audible frequencies. The typical output frequency of MCP8063 is 23 kHz.

4.2 Frequency Generator Function

The Frequency Generator output is a “Hall-sensor equivalent” digital output, giving information to an external controller about the speed and phase of the motor. The FG pin is an open-drain output, connecting to a logical voltage level through an external pull-up resistor. When a lock (or out-of-sync) situation is detected by the driver, this output is set to high impedance until the motor is restarted. Leave the pin open when not used. The FG signal can be used to compute the motor speed in rotations per minute (RPM). Typically, for a four-pole BLDC fan (4P/6S), the speed in RPMs is 30 x FG frequency (Hz).

\[
\frac{FG \times 720}{(P \times S)} = \text{Rotor speed RPM}
\]

Where:
- \( P \) = Total number of poles in the motor
- \( S \) = Total number of slots in the motor

4.3 Lock-Up Protection and Automatic Restart

If the motor is stopped (blocked) or if it loses synchronization with the driver, a lock-up protection circuit detects this situation and ties the outputs to GND in order to dissipate the remaining energy from the rotor with a minimum of self-heating. After a “waiting time" (\( T_{\text{WAIT}} \)), the lock-up protection is released and normal operation resumes for a given time (\( T_{\text{RUN}} \)). In case the motor is still blocked, a new period of waiting time is started. \( T_{\text{WAIT}} \) and \( T_{\text{RUN}} \) timings are fixed internally, so that no external capacitor is needed.

4.4 Overcurrent Limitation

The motor peak current is limited by the driver to a fixed value (defined internally), thus limiting the maximum power dissipation in the coils.

4.5 Thermal Shutdown

The MCP8063 device has a thermal protection function which detects when the die temperature exceeds \( T_{SD} = +170^\circ C \). When this temperature is reached, the circuit enters Thermal Shutdown mode and the outputs OUT1, OUT2 and OUT3 are tied to GND in order to dissipate the remaining energy from the rotor with a minimum of self-heating. Once the junction temperature (\( T_{SD} \)) has dropped below +145°C, the normal operation resumes (the thermal detection circuit has +25°C hysteresis function).

4.6 Internal Voltage Regulator

\( V_{\text{BIAS}} \) voltage is generated internally and is used to supply internal logical blocks. The \( V_{\text{BIAS}} \) pin is used to connect an external decoupling capacitor (1 µF or higher). Notice that this pin is for IC internal use and is not designed to supply DC current to external blocks.

4.7 Overvoltage Shutdown

The MCP8063 device has an overvoltage protection function which detects when the \( V_{DD} \) voltage exceeds \( V_{OV} = +18.5V \). When this temperature is reached, the circuit enters Thermal Shutdown mode, and outputs OUT1, OUT2 and OUT3 are disabled (high impedance).
5.0 PACKAGING INFORMATION

5.1 Package Marking Information

Legend:

XX...X  Customer-specific information
Y       Year code (last digit of calendar year)
YY      Year code (last 2 digits of calendar year)
WW      Week code (week of January 1 is week ‘01’)
NNN     Alphanumeric traceability code
Pb-free JEDEC® designator for Matte Tin (Sn)
*       This package is Pb-free. The Pb-free JEDEC designator (Pb-free) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

APPENDIX A: REVISION HISTORY

Revision B (November 2014)

The following is the list of modifications:
1. Changed FG Maximum Output Voltage values under Absolute Maximum Ratings† section
2. Changed Power Supply Voltage value under Absolute Maximum Ratings† section.
3. Added Input Overvoltage Value in Electrical Characteristics table.

Revision A (February 2014)

• Original Release of this Document.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
