HV9961

LED Driver with Average-Current Mode Constant-Current Control

Features

- Fast Average Current Control
- Programmable Constant Off-time Switching
- Linear Dimming Input
- PWM Dimming Input
- Output Short-circuit Protection with Skip Mode
- –40°C to +125°C Ambient Operating Temperature
- Pin-compatible with HV9910B

Applications

- DC/DC or AC/DC LED Driver Applications
- LED Backlight Driver for LCD Displays
- General Purpose Constant-current Source
- LED Signage and Displays
- Architectural and Decorative LED Lighting
- LED Street Lighting

General Description

The HV9961 is an Average-Current mode constant-current control LED driver IC operating in a constant Off-time mode. Unlike the HV9910B, this control IC does not produce a peak-to-average error. This greatly improves accuracy as well as the line and load regulations of the LED current without any need for loop compensation or high-side current sensing. Its output LED current accuracy is ±3%.

The IC is equipped with a current limit comparator for Hiccup mode output short-circuit protection.

The HV9961 can be powered from an 8V–450V supply. It has a PWM dimming input that accepts an external control TTL-compatible signal. In addition, the output current can be programmed by an internal 275 mV reference or controlled externally through a 0V–1.5V linear dimming input.

The HV9961 is pin-to-pin compatible with HV9910B, and it can be used as a drop-in replacement for many applications to improve LED current accuracy and regulation.

Package Types

See Table 2-1 for pin information.

3.0 APPLICATION INFORMATION

3.1 General Description

Peak current control (as in HV9910B) is the simplest and the most economical way to regulate a buck converter's output current. However, it suffers accuracy and regulation problems that arise from peak-to-average current error, contributed by the current ripple in the output inductor and the propagation delay in the current sense comparator. The full inductor current signal is unavailable for direct switch current sensing across the sense resistor at the ground path in this low-side switch buck converter when the control switch is at the ground potential because the switch is turned off. While it is very simple to detect the peak current in the switch, controlling the average inductor current is usually implemented by level translating the sense signal from +V_IN. Although this is practical for a relatively low-input voltage, V_IN, this type of average-current control may become excessively complex and expensive in the offline AC or other high-voltage DC applications.

The HV9961 uses a proprietary control scheme that allows fast and accurate control of the average current in the buck inductor by sensing the switch current only. No compensation of the current control loop is required. The output LED current's response to PWMD input is similar to that of the HV9910B. The effect of inductor current ripple amplitude on this control scheme is insignificant. Therefore, the LED current is independent of the variation in inductance, switching frequency or output voltage. Constant off-time control of the buck converter is used for stability and improving the LED current regulation over a wide range of input voltages. Unlike HV9910B, the HV9961 does not support Constant Frequency mode.

3.2 Off Timer

The timing resistor connected between RT and GND determines the off-time of the gate driver. Wiring this resistor between RT and Gate as with HV9910B is no longer supported. Refer to Equation 3-1 for the computation of the gate output's off-time.

**EQUATION 3-1:**

\[ T_{OFF(\mu s)} = \frac{R_T(k\Omega)}{25} + 0.3 \]

within the range of 30 kΩ ≤ R_T ≤ 1 MΩ

3.3 Average-Current Control Feedback and Output Short-circuit Protection

The current through the switching Metal-oxide Semiconductor Field-effect Transistor (MOSFET) source is averaged and used to give constant-current feedback. This current is detected with a sense resistor at the CS pin. The feedback operates in a fast Open-loop mode. No compensation is required. Output current is programmed as seen in Equation 3-2.

**EQUATION 3-2:**

\[ I_{LED} = \frac{0.275V}{R_{CS}} \]

When the voltage at the LD input V_LD ≥ 1.5V

If the voltage at the LD input is less than 1.5V, the output current is computed as specified in Equation 3-3.

**EQUATION 3-3:**

\[ I_{LED} = \frac{V_{LD} \times 0.185}{R_{CS}} \]

When the voltage at the LD input 0.2V ≤ V_LD < 1.5V

The above equations are only valid for continuous conduction of the output inductor. It is good design practice to choose the inductance of the inductor such that the peak-to-peak inductor current is 30% to 40% of the average DC full-load current. Hence, the recommended inductance can be calculated as shown in Equation 3-4.

**EQUATION 3-4:**

\[ L_O = \frac{V_{O(MAX)} \times T_{OFF}}{0.4 \times I_O} \]

The duty-cycle range of the current control feedback is limited to D ≤ 0.75. A reduction in the LED current may occur when the desired LED string voltage V_O is greater than 75% of the input voltage V_IN of the HV9961 LED driver.

Reducing the targeted output LED string voltage V_O below V_O(MIN) = V_IN × D_MIN, where D_MIN = 1 µs/(T_OFF +1 µs), may also result in the loss of regulation of the LED current. This condition, however, causes an increase in the LED current and can potentially trip the short-circuit protection comparator.

The typical output characteristic of the HV9961 LED driver is shown in Figure 3-1. The corresponding HV9910B characteristic is given for the comparison.
FIGURE 3-1: Typical Output Characteristic of an HV9961 LED Driver.

The short-circuit protection comparator trips when the voltage at CS exceeds 0.44V. When this occurs, the short-circuit gate off-time $T_{HICCUP} = 400 \mu s$ is generated to prevent the staircasing of the inductor current and, potentially, its saturation due to insufficient output voltage. The typical short-circuit inductor current is shown in the waveform of Figure 3-2.

FIGURE 3-2: Short-circuit Inductor Current.

A leading-edge blanking delay is provided at CS to prevent false triggering of the current feedback and the short-circuit protection.

3.4 Linear Dimming

When the voltage at LD falls below 1.5V, the internal 275 mV reference to the constant-current feedback becomes overridden by $V_{LD} \times 0.185$. As long as the current in the inductor remains continuous, the LED current is given by Equation 3-3. However, when $V_{LD}$ falls below 150 mV, the gate output becomes disabled. The gate signal recovers when $V_{LD}$ exceeds 200 mV. It is required in some applications to use the same brightness control signal input to shut off the lamp. The typical linear dimming response is shown in Figure 3-3.

FIGURE 3-3: Typical Linear Dimming Response of an HV9961 LED Driver.

The linear dimming input could also be used for “mixed-mode” dimming to expand the dimming ratio. In such case, a pulse-width modulated signal with an amplitude below 1.5V should be applied to LD.

3.5 Input Voltage Regulator

The HV9961 can be powered directly from an 8 VDC–450 VDC supply through its $V_{IN}$ input. When this voltage is applied at the $V_{IN}$ pin, the HV9961 maintains a constant 7.5V level at $V_{DD}$. This voltage can be used to power the IC and external circuitry connected to $V_{DD}$ within the rated maximum current or within the thermal ratings of the package, whichever limit is lower. The $V_{DD}$ pin must be bypassed by a low ESR capacitor to provide a low-impedance path for the high-frequency current of the gate output. The HV9961 can also be powered through the $V_{DD}$ pin directly with a voltage greater than the internally regulated 7.5V, but less than 12V.

Despite the instantaneous voltage rating of 450V, continuous voltage at $V_{IN}$ is limited by the power dissipation in the package. For example, when HV9961 draws $I_{IN} = 2.5 \text{ mA}$ from the $V_{IN}$ input, and the 8-pin SOIC package is used, the maximum continuous voltage at $V_{IN}$ is limited to the value shown in Equation 3-5.

EQUATION 3-5:

$$V_{IN(MAX)} = \frac{T_{J(MAX)} - T_{A}}{R_{\theta JA} \times I_{IN}}$$

$$= 396 \text{ V}$$

Where:

- Ambient temperature: $T_A = 25^\circ \text{C}$
- Maximum working junction temperature: $T_{J(MAX)} = 125^\circ \text{C}$
- Junction-to-ambient thermal resistance: $R_{\theta JA} = 101^\circ \text{C/W}$
In such cases, when it is needed to operate the HV9961 from a higher voltage, a resistor or a Zener diode can be added in series with the $V_{IN}$ input to divert some of the power loss from the HV9961. In the above example, using a 100V Zener diode will allow the circuit to work up to 490V. The input current drawn from the $V_{IN}$ pin is represented by Equation 3-6.

**EQUATION 3-6:**

$$I_{IN} \approx 1mA + Q_G \times f_s$$

Where:
- $f_s$ = Switching frequency
- $Q_G$ = Gate charge of the external FET (obtained from the manufacturer’s data sheet)

### 3.6 Gate Output

The gate output of the HV9961 is used to drive an external MOSFET. It is recommended that the gate charge $Q_G$ of the external MOSFET be less than 25 nC for switching frequencies ≤100 kHz and less than 15 nC for switching frequencies >100 kHz.

### 3.7 PWM Dimming

Due to the fast open-loop response of the average-current control loop of the HV9961, its PWM dimming performance nearly matches that of the HV9910B. The inductor current waveform comparison is shown in Figure 3-4.

**FIGURE 3-4: Typical PWM Dimming Response of an HV9961 LED Driver.**

The rising and falling edges are limited by the current slew rate in the inductor. The first switching cycle is terminated upon reaching the 275 mV or $V_{LD} \times 0.185$ level at CS. The circuit is further reaching its steady-state within 3–4 switching cycles regardless of the switching frequency.
4.0 PACKAGING INFORMATION

4.1 Package Marking Information

Legend:
- XX...X  Product Code or Customer-specific information
- Y       Year code (last digit of calendar year)
- YY      Year code (last 2 digits of calendar year)
- WW      Week code (week of January 1 is week '01')
- NNN     Alphanumeric traceability code
- @3      Pb-free JEDEC® designator for Matte Tin (Sn)
*         This package is Pb-free. The Pb-free JEDEC designator (@3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for product code or customer-specific information. Package may or not include the corporate logo.
8-Lead SOIC (Narrow Body) Package Outline (LG/TG)
4.90x3.90mm body, 1.75mm height (max), 1.27mm pitch

Note: For the most current package drawings, see the Microchip Packaging Specification at www.microchip.com/packaging.

Note: This chamfer feature is optional. A Pin 1 identifier must be located in the index area indicated. The Pin 1 identifier can be: a molded mark/identifier; an embedded metal marker; or a printed indicator.

APPENDIX A:  REVISION HISTORY

Revision A (November 2017)

• Converted Supertex Doc# DSFP-HV9961 to Microchip DS20005588A
• Changed the package marking format
• Changed the packaging quantity of the LG package from 2500/Reel to 3300/Reel
• Changed the packaging quantity of the NG M901 media type from 1000/Reel to 2600/Reel
• Changed the packaging quantity of the NG M934 media type from 2500/Reel to 2600/Reel
• Made minor text changes throughout the document
# PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, contact your local Microchip representative or sales office.

- **Device:** HV9961 = LED Driver with Average-Current Mode Constant-Current Control
- **Packages:** LG = 8-lead SOIC, NG = 16-lead SOIC
- **Environmental:** G = Lead (Pb)-free/RoHS-compliant Package
- **Media Types:** (blank) = 3300/Reel for an LG Package, M901 = 2600/Reel for an NG Package, M934 = 2600/Reel for an NG Package

Note: For Media Types M901 and M934, the base quantity for tape and reel was standardized to 2600/reel. Both options will result in the delivery of the same number of parts/reel.

### Examples:

- **a) HV9961LG-G:** LED Driver with Average-Current Mode Constant-Current Control, 8-lead SOIC, 3300/Reel
- **b) HV9961NG-G:** LED Driver with Average-Current Mode Constant-Current Control, 16-lead SOIC, 45/Tube
- **c) HV9961NG-G-M901:** LED Driver with Average-Current Mode Constant-Current Control, 16-lead SOIC, 2600/Reel
- **d) HV9961NG-G-M934:** LED Driver with Average-Current Mode Constant-Current Control, 16-lead SOIC, 2600/Reel
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
