Features

- High Current Capability:
  - MIC29150/29151/29152/29153: 1.5A
  - MIC29300/29301/29302/29303: 3A
  - MIC29500/29501/29502/29503: 5A
  - MIC29751/29752: 7.5A
- Low Dropout Voltage
- Low Ground Current
- Accurate 1% Guaranteed Tolerance
- Extremely Fast Transient Response
- Reverse-Battery and “Load Dump” Protection
- Zero-Current Shutdown Mode (5-Pin Versions)
- Error Flag Signals Output Out-of-Regulation (5-Pin Versions)
- Also Characterized for Smaller Loads with Industry-Leading Performance Specifications
- Fixed-Voltage and Adjustable Versions

Applications

- Battery-Powered Equipment
- High-Efficiency Green Computer Systems
- Automotive Electronics
- High-Efficiency Linear Power Supplies
- High-Efficiency Post-Regulator for Switching Supply

General Description

The MIC2915x/2930x/2950x/2975x are high current, high accuracy, low dropout voltage regulators. Using Microchip’s proprietary Super beta PNP process with a PNP pass element, these regulators feature 350 mV to 425 mV (full load) typical dropout voltages and very low ground current. Designed for high current loads, these devices also find applications in lower current, extremely low dropout-critical systems, where their tiny dropout voltage and ground current values are important attributes.

The MIC2915x/2930x/2950x/2975x are fully protected against overcurrent faults, reversed input polarity, reversed lead insertion, overtemperature operation, and positive and negative transient voltage spikes. Five pin fixed-voltage versions feature logic level ON/OFF control and an error flag that signals whenever the output falls out of regulation. Flagged states include low input voltage (dropout), output current limit, overtemperature shutdown, and extremely high voltage spikes on the input.

On the MIC29xx1 and MIC29xx2, the ENABLE pin may be tied to V_IN if it is not required for ON/OFF control. The MIC2915x/2930x/2950x are available in 3-pin and 5-pin TO-220 and surface mount TO-263 (D²Pak) packages. The MIC2975x 7.5A regulators are available in a 5-pin TO-247 package. The 1.5A, adjustable output MIC29152 is available in a 5-pin power D-Pak (TO-252) package.

For applications with input voltage 6V or below, see MIC37xxx LDOs.

Absolute Maximum Ratings † (Note 1)

- Input Supply Voltage (V<sub>IN</sub>) (Note 1) ................................................................. –20V to +60V
- Enable Input Voltage (V<sub>EN</sub>) ........................................................................... –0.3V to V<sub>IN</sub>
- Power Dissipation ........................................................................................................ Internally Limited
- ESD Rating ..................................................................................................................... Note 2

Operating Ratings‡

- Maximum Operating Input Voltage .................................................................................. +26V

† Notice: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

‡ Notice: The device is not guaranteed to function outside its operating ratings.

Note 1: Maximum positive supply voltage of 60V must be of limited duration (<100 ms) and duty cycle (≤1%). The maximum continuous supply voltage is 26V. Exceeding the absolute maximum rating may damage the device.

2: Devices are ESD sensitive. Handling precautions recommended.
## TABLE 1-1:  ELECTRICAL CHARACTERISTICS (Note 1, Note 2)

</tr>
</tbody>
</table>

**Note 1:** Specification for packaged product only.

**Note 2:** When used in dual supply systems where the regulator load is returned to a negative supply, the output voltage must be diode clamped to ground.

**Note 3:** Full load current ($I_{FL}$) is defined as 1.5A for the MIC2915x, 3A for the MIC2930x, 5A for the MIC2950x, and 7.5A for the MIC2975x families.

**Note 4:** Output voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature range.

**Note 5:** Dropout voltage is defined as the input-to-output differential when the output voltage drops to 99% of its normal value with $V_{OUT} + 1V$ applied to $V_{IN}$.

**Note 6:** Ground pin current is the regulator quiescent current. The total current drawn from the source is the sum of the load current plus the ground pin current.

**Note 7:** $V_{IN} = V_{OUT}$ (nominal) + 1V. For example, use $V_{IN} = 4.3V$ for a 3.3V regulator or use 6V for a 5V regulator. Employ pulse-testing procedures to pin current.

**Note 8:** $V_{REF} \leq V_{OUT} \leq (V_{IN} - 1V), 2.3V \leq V_{IN} \leq 26V, 10$ mA $< I_L \leq I_{FL}$, $T_J \leq T_{JMAX}$.

**Note 9:** Thermal regulation is defined as the change in output voltage at a time $T$ after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a 200 mA load pulse at $V_{IN} = 20V$ (a 4W pulse) for $T = 10$ ms.

**Note 10:** Comparator thresholds are expressed in terms of a voltage differential at the adjust terminal below the nominal reference voltage measured at 6V input. To express these thresholds in terms of output voltage change, multiply by the error amplifier gain = $V_{OUT}/V_{REF} = (R1 + R2)/R2$. For example, at a programmed output voltage of 5V, the error output is guaranteed to go low when the output drops by 95 mV x 5V/1.240V = 384 mV. Thresholds remain constant as a percent of $V_{OUT}$ as $V_{OUT}$ is varied, with the dropout warning occurring at typically 5% below nominal, 7.7% guaranteed.

**Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., T_A, T_J, θ_JA). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.
2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Active-low error flag output signal that indicates an output fault condition.
4.0 APPLICATION INFORMATION

The MIC2915x, MIC2930x, MIC2950x, and MIC2975x are high-performance low-dropout voltage regulators suitable for all moderate to high-current voltage regulator applications. Their 350 mV to 425 mV typical dropout voltage at full load make them especially valuable in battery-powered systems and as high efficiency noise filters in post-regulator applications.

Unlike older NPN-pass transistor designs, where the minimum dropout voltage is limited by the base-emitter voltage drop and collector-emitter saturation voltage, dropout performance of the PNP output of these devices is limited merely by the low VCE saturation voltage.

A trade-off for the low-dropout voltage is a varying base driver requirement. But Microchip's Super ßeta PNP process reduces this drive requirement to merely 1% of the load current.

The MIC2915x/2930x/2950x/2975x family of regulators are fully protected from damage due to fault conditions. Current limiting is provided. This limiting is linear; output current under overload conditions is constant. Thermal shutdown disables the device when the die temperature exceeds the +125°C maximum safe operating temperature. Line transient protection allows device and load survival even when the input voltage spikes between −20V and +60V. When the input voltage exceeds approximately 32V, the overvoltage sensor disables the regulator. The output structure of these regulators allows voltages in excess of the desired output voltage to be applied without reverse current flow. MIC29xx1 and MIC29xx2 versions offer a logic-level ON/OFF control. When disabled, the devices draw nearly zero current.

An additional feature of this regulator family is a common pinout. A design's current requirement may change up or down, but use the same board layout because all of these regulators have identical pinouts.

4.1 Thermal Design

Linear regulators are simple to use. The most complicated design parameters to consider are thermal characteristics. Thermal design requires the following application-specific parameters:
- Maximum Ambient Temperature, $T_A$
- Output Current, $I_{OUT}$
- Output Voltage, $V_{OUT}$
- Input Voltage, $V_{IN}$

First, calculate the power dissipation of the regulator from these numbers and the device parameters from this data sheet.

**EQUATION 4-1:**

$$P_D = I_{OUT}(1.01(V_{IN} - V_{OUT}))$$

The ground current is approximated by 1% of $I_{OUT}$. Then the heat sink thermal resistance is determined with **Equation 4-2**.

**EQUATION 4-2:**

$$\theta_{SA} = \frac{T_{JMAX} - T_A}{P_D} - (\theta_{JC} + \theta_{CS})$$

Where:
- $T_{JMAX}$ ≤ 125°C
- $\theta_{CS}$ Between 0°C/W and 2°C/W

The heat sink may be significantly reduced in applications where the minimum input voltage is known and is large compared with the dropout voltage. Use a series input resistor to drop excessive voltage and distribute the heat between this resistor and the regulator. The low-dropout properties of Super ßeta PNP regulators allow very significant reductions in regulator power dissipation and the associated heat sink without compromising performance. When this technique is employed, a capacitor of at least 0.1 µF is needed directly between the input and regulator ground.

Please refer to Application Note 9 and Application Hint 17 for further details and examples on thermal design and heat sink specification.

With no heat sink in the application, calculate the junction temperature to determine the maximum power dissipation that will be allowed before exceeding the maximum junction temperature of the MIC29152. The maximum power allowed can be calculated using the...
thermal resistance ($\theta_{JA}$) of the D-Pak adhering to the following criteria for the PCB design: 2 oz. copper and 100 mm$^2$ copper area for the MIC29152.

For example, given an expected maximum ambient temperature ($T_A$) of +75°C with $V_{IN} = 3.3V$, $V_{OUT} = 2.5V$, and $I_{OUT} = 1.5A$, first calculate the expected $P_D$ using Equation 4-3:

\[
P_D = (3.3V - 2.5V) \times 1.5A - (3.3V \times 0.016A) = 1.1472W
\]

Next, calculate the junction temperature for the expected power dissipation.

\[
T_J = (\theta_{JA} \times P_D) + T_A
= (56^\circ C/W \times 1.1472W) + 75^\circ C = 139.24^\circ C
\]

Now determine the maximum power dissipation allowed that would not exceed the IC’s maximum junction temperature (+125°C) without the use of a heat sink.

\[
P_{DMAX} = (T_{J(MAX)} - T_A) / \theta_{JA}
= (125^\circ C - 75^\circ C) / 56^\circ C/W = 0.893W
\]

### 4.2 Capacitor Requirements

For stability and minimum output noise, a capacitor on the regulator output is necessary. The value of this capacitor is dependent upon the output current; lower currents allow smaller capacitors. The MIC2915x, MIC2930x, MIC2950x, and MIC2975x regulators are stable with the following minimum capacitor values at full load, as noted in Table 4-1.

<table>
<thead>
<tr>
<th>Device</th>
<th>Full-Load Capacitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIC2915x</td>
<td>10 µF</td>
</tr>
<tr>
<td>MIC2930x</td>
<td>10 µF</td>
</tr>
<tr>
<td>MIC2950x</td>
<td>10 µF</td>
</tr>
<tr>
<td>MIC2975x</td>
<td>22 µF</td>
</tr>
</tbody>
</table>

This capacitor need not be an expensive low ESR type: aluminum electrolytics are adequate. In fact, extremely low ESR capacitors may contribute to instability. Tantalum capacitors are recommended for systems where fast load transient response is important. Where the regulator is powered from a source with high AC impedance, a 0.1 µF capacitor connected between Input and GND is recommended. This capacitor should have good characteristics to above 250 kHz.

### 4.3 Minimum Load Current

The MIC2915x–2975x regulators are specified between finite loads. If the output current is too small, leakage currents dominate and the output voltage rises. The following minimum load current swamps any expected leakage current across the operating temperature range, as shown in Table 4-2.

<table>

<tr>
<td>MIC2950x</td>
<td>10 mA</td>
</tr>
<tr>
<td>MIC2975x</td>
<td>10 mA</td>
</tr>
</tbody>
</table>

### 4.4 Adjustable Regulator Design

The adjustable regulator versions, MIC29xx2 and MIC29xx3, allow programming the output voltage anywhere between 1.25V and 25V. Two resistors are used. The resistor values are calculated by Equation 4-6.

\[
R1 = R2 \times \left( \frac{V_{OUT}}{1.240} - 1 \right)
\]

In the equation above, $V_{OUT}$ is the desired output voltage. Figure 4-2 shows component definition. Applications with widely varying load currents may scale the resistors to draw the minimum load current required for proper operation (see the Minimum Load Current sub-section).
4.5 Error Flag

MIC29xx1 and MIC29xx3 versions feature an Error Flag, which looks at the output voltage and signals an error condition when this voltage drops 5% below its expected value. The error flag is an open-collector output that pulls low under fault conditions. It may sink 10 mA. Low output voltage signifies a number of possible problems, including an overcurrent fault (the device is in current-limit) and low input voltage. The flag output is inoperative during overtemperature shutdown conditions.

4.6 Enable Input

MIC29xx1 and MIC29xx2 versions feature an enable (EN) input that allows ON/OFF control of the device. Special design allows “zero” current drain when the device is disabled; only microamperes of leakage current flows. The EN input has TTL/CMOS compatible thresholds for simple interfacing with logic, or may be directly tied to ≤30V. Enabling the regulator requires approximately 20 µA of current.

APPENDIX A: REVISION HISTORY

Revision A (December 2016)

• Converted Micrel document MIC2915x/30x/50x/75x to Microchip data sheet DS20005685A.
• Minor text changes throughout.
• Removed references to the discontinued MIC29750.
• Added Figure 2-41, Figure 2-42, and Figure 2-43.
• Removed the 3-Pin TO-247 package option.
PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, contact your local Microchip representative or sales office.

### PART NO. | XX | X | X | XX

### Examples:

a) **MIC29150-3.3WT:** 1.5A High-Current Low-Dropout Regulator, 3.3V, –40°C to +125°C Temperature Range, 3-Lead TO-220, 50/Tube

b) **MIC29152WD-TR:** 1.5A High-Current Low-Dropout Regulator, Adjustable Voltage, –40°C to +125°C Temperature Range, 5-Lead TO-252, 2,500/Reel

c) **MIC29302WU:** 3A High-Current Low-Dropout Regulator, Adjustable Voltage, –40°C to +125°C Temperature Range, 5-Lead TO-263, 50/Tube

d) **MIC29301-12WU-TR:** 3A High-Current Low-Dropout Regulator, 12V, –40°C to +125°C Temperature Range, 5-Lead TO-263, 750/Reel

e) **MIC29500-5.0WT:** 5A High-Current Low-Dropout Regulator, 5.0V, –40°C to +125°C Temperature Range, 3-Lead TO-220, 50/Tube

f) **MIC29503WT:** 5A High-Current Low-Dropout Regulator, Adjustable Voltage, –40°C to +125°C Temperature Range, 5-Lead TO-220, 50/Tube

g) **MIC29751-3.3WWT-TR:** 7.5A High-Current Low-Dropout Regulator, 3.3V, –40°C to +125°C Temperature Range, 5-Lead TO-247, 2,500/Reel

h) **MIC29752WWT:** 7.5A High-Current Low-Dropout Regulator, Adjustable Voltage, –40°C to +125°C Temperature Range, 5-Lead TO-247, 30/Tube

### Note 1:
Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Microchip makes no representations or warranties of any kind whether express or implied, written or oral, statutory or otherwise, related to the information, including but not limited to its condition, quality, performance, merchantability or fitness for purpose. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
