MIC5205

150 mA Low-Noise LDO Regulator

Features

• Ultra-Low Noise Output
• High Output Voltage Accuracy
• Guaranteed 150 mA Output
• Low Quiescent Current
• Low Dropout Voltage
• Extremely Tight Load and Line Regulation
• Very Low Temperature Coefficient
• Current and Thermal Limiting
• Reverse-Battery Protection
• Zero Off-Mode Current
• Logic-Controlled Electronic Enable

Applications

• Cellular Telephones
• Laptop, Notebook, and Palmtop Computers
• Battery-Powered Equipment
• PCMCIA VCC and VPP Regulation/Switching
• Consumer/Personal Electronics
• SMPS Post-Regulator and DC/DC Modules
• High-Efficiency Linear Power Supplies

General Description

The MIC5205 is an efficient linear voltage regulator with ultra low-noise output, very low dropout voltage (typically 17 mV at light loads and 165 mV at 150 mA), and very low ground current (600 µA at 100 mA output). The MIC5205 offers better than 1% initial accuracy.

Designed especially for hand-held, battery-powered devices, the MIC5205 includes a CMOS or TTL compatible enable/shutdown control input. When shut down, power consumption drops nearly to zero. Regulator ground current increases only slightly in dropout, further prolonging battery life.

Key MIC5205 features include a reference bypass pin to improve its already excellent low-noise performance, reversed-battery protection, current limiting, and overtemperature shutdown.

The MIC5205 is available in fixed and adjustable output voltage versions in a small SOT-23-5 package.

For low-dropout regulators that are stable with ceramic output capacitors, see the µCap MIC5245/6/7 family.

Package Type

MIC5205
5-Lead SOT-23 (M5)
Typical Application Circuit

**MIC5205**

5-Lead SOT-23

COUT = 2.2μF tantalum

Low-Noise Operation:
C_{BYP} = 470pF, C_{OUT} ≥ 2.2μF

Basic Operation:
C_{BYP} = not used, C_{OUT} ≥ 1μF

Enable
Shutdown

EN (pin 3) may be connected directly to IN (pin 1).

Functional Block Diagrams

Ultra-Low Noise Fixed Regulator

\[ V_{OUT} = V_{REF} \left(1 + \frac{R2}{R1}\right) \]

Ultra-Low Noise Adjustable Regulator
1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Supply Input Voltage (V-IN) .......................................................................................................................... −20V to +20V
Enable Input Voltage (V-EN) ......................................................................................................................... −20V to +20V
Power Dissipation (PD) (Note 1) ............................................................................................................ Internally Limited

Operating Ratings ‡

Supply Input Voltage (V-IN) ......................................................................................................................... +2.5V to +16V
Enable Input Voltage (V-EN) .................................................................................................................................0V to VIN

† Notice: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

‡ Notice: The device is not guaranteed to function outside its operating ratings.

Note 1: The maximum allowable power dissipation at any T_A (ambient temperature) is PD(max) = (T_J(max) − T_A)/θJA. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown. The θJA of the MIC5205-xxYM5 (all versions) is 220°C/W mounted on a PC board.

**Note 1:** Output voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature range.

2: Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 0.1 mA to 150 mA. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

3: Dropout Voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at 1V differential.

4: Ground pin current is the regulator quiescent current plus pass transistor base current. The total current drawn from the supply is the sum of the load current plus the ground pin current.

5: Thermal regulation is defined as the change in output voltage at a time “t” after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a 150 mA load pulse at $V_{IN} = 16V$ for $t = 10$ ms.

**Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., $T_A$, $T_J$, $\theta_{JA}$). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.

**Note 2:** The maximum allowable power dissipation at any $T_A$ (ambient temperature) is $P_{D(max)} = \frac{(T_J(max) - T_A)}{\theta_{JA}}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown. The $\theta_{JA}$ of the MIC5205-xxYM5 (all versions) is 220°C/W mounted on a PC board.

4.0 APPLICATION INFORMATION

4.1 Enable/Shutdown
Forcing EN (enable/shutdown) high (greater than 2V) enables the regulator. EN is compatible with CMOS logic gates.

If the enable/shutdown feature is not required, connect EN (pin 3) to IN (supply input, pin 1). See Figure 4-1.

4.2 Input Capacitor
A 1 µF capacitor should be placed from IN to GND if there are more than 10 inches of wire between the input and the AC filter capacitor or if a battery is used as the input.

4.3 Reference Bypass Capacitor
BYP (reference bypass) is connected to the internal voltage reference. A 470 pF capacitor (C_BYP) connected from BYP to GND quiets this reference, providing a significant reduction in output noise. C_BYP reduces the regulator phase margin; when using C_BYP, output capacitors of 2.2 µF or greater are generally required to maintain stability.

The start-up speed of the MIC5205 is inversely proportional to the size of the reference bypass capacitor. Applications requiring a slow ramp-up of output voltage should consider larger values of C_BYP. Likewise, if rapid turn-on is necessary, consider omitting C_BYP.

If output noise is not a major concern, omit C_BYP and leave BYP open.

4.4 Output Capacitor
An output capacitor is required between OUT and GND to prevent oscillation. The minimum size of the output capacitor is dependent upon whether a reference bypass capacitor is used. 1.0 µF minimum is recommended when C_BYP is not used (see Figure 4-2). 2.2 µF minimum is recommended when C_BYP is 470 pF (see Figure 4-1). Larger values improve the regulator’s transient response. The output capacitor value may be increased without limit.

The output capacitor should have an ESR (effective series resistance) of about 5Ω or less and a resonant frequency above 1 MHz. Ultra-low-ESR capacitors can cause a low amplitude oscillation on the output and/or underdamped transient response. Most tantalum or aluminum electrolytic capacitors are adequate; film types will work, but are more expensive. Because many aluminum electrolytics have electrolytes that freeze at about −30°C, solid tantalums are recommended for operation below −25°C.

At lower values of output current, less output capacitance is required for output stability. The capacitor can be reduced to 0.47 µF for current below 10 mA or 0.33 µF for currents below 1 mA.

4.5 No-Load Stability
The MIC5205 will remain stable and in regulation with no load (other than the internal voltage divider) unlike many other voltage regulators. This is especially important in CMOS RAM keep-alive applications.

4.6 Thermal Considerations
The MIC5205 is designed to provide 150 mA of continuous current in a very small package. Maximum power dissipation can be calculated based on the output current and the voltage drop across the part. To determine the maximum power dissipation of the package, use the junction-to-ambient thermal resistance of the device and the following basic equation:

EQUATION 4-1:

\[ P_{D(MAX)} = \frac{(T_{J(MAX)} - T_A)}{\theta_{JA}} \]

\( T_{J(MAX)} \) is the maximum junction temperature of the die, 125°C, and \( T_A \) is the ambient operating temperature. \( \theta_{JA} \) is layout dependent; Table 4-1 shows examples of junction-to-ambient thermal resistance for the MIC5205.

TABLE 4-1: SOT-23-5 THERMAL RESISTANCE

<table>
<thead>
<tr>
<th>Package</th>
<th>( \theta_{JA} ) Rec. Min. Footprint</th>
<th>( \theta_{JA} ) Square Copper Clad</th>
<th>( \theta_{JC} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOT-23-5 (M5)</td>
<td>220°C/W</td>
<td>170°C/W</td>
<td>130°C/W</td>
</tr>
</tbody>
</table>

The actual power dissipation of the regulator circuit can be determined using the equation:

EQUATION 4-2:

\[ P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_{GND} \]

Substituting \( P_{D(MAX)} \) for \( P_D \) and solving for the operating conditions that are critical to the application will give the maximum operating conditions for the
regulator circuit. For example, when operating the MIC5205-3.3YM5 at room temperature with a minimum footprint layout, the maximum input voltage for a set output current can be determined as follows:

\[
P_{D(MAX)} = \frac{(125°C - 25°C)}{220°C/W} = 455mW
\]

The junction-to-ambient thermal resistance for the minimum footprint is 22°C/W, from Table 4-1. The maximum power dissipation must not be exceeded for proper operation. Using the output voltage of 3.3V and an output current of 150 mA, the maximum input voltage can be determined. From the Electrical Characteristics table, the maximum ground current for 150 mA output current is 2500 µA or 2.5 mA.

\[
455mW = (V_{IN} - 3.3V) \times 150mA + V_{IN} \times 2.5mA
\]

\[
455mW = V_{IN} \times 150mA - 495mW + V_{IN} \times 2.5mA
\]

\[
950mW = V_{IN} \times 152.5mA
\]

\(V_{IN(MAX)}\) then equates out to 6.23V. Therefore, a 3.3V application at 150 mA of output current can accept a maximum input voltage of 6.2V in a SOT-23-5 package. For a full discussion of heat sinking and thermal effects on voltage regulators, refer to the Regulator Thermals section of Microchip’s Designing with Low-Dropout Voltage Regulators handbook.

4.7 Fixed Regulator Applications

Figure 4-1 includes a 470 pF capacitor for low-noise operation and shows EN (pin 3) connected to IN (pin 1) for an application where enable/shutdown is not required. \(C_{OUT} = 2.2 \mu F\) minimum.

\[
\text{FIGURE 4-1: Ultra-Low Noise Fixed Voltage Application.}
\]

Figure 4-2 is an example of a low-noise configuration where \(C_{BYP}\) is not required. \(C_{OUT} = 1 \mu F\) minimum.

\[
\text{FIGURE 4-2: Low Noise Fixed Voltage Application.}
\]

4.8 Adjustable Regulator Applications

The MIC5205YM5 can be adjusted to a specific output voltage by using two external resistors (Figure 4-3). The resistors set the output voltage based on the following equation:

\[
V_{OUT} = 1.242V \times \left(\frac{R_2}{R_1} + 1\right)
\]

This equation is correct due to the configuration of the bandgap reference. The bandgap voltage is relative to the output, as seen in the block diagram. Traditional regulators normally have the reference voltage relative to ground and have a different \(V_{OUT}\) equation.

Resistor values are not critical because ADJ (adjust) has a high input impedance, but for best results use resistors of 470 kΩ or less. A capacitor from ADJ to ground provides greatly improved noise performance.
4.9 Adjustable Voltage Application

Figure 4-3 includes the optional 470 pF noise bypass capacitor from ADJ to GND to reduce output noise.

4.10 Dual-Supply Operation

When used in dual supply systems where the regulator load is returned to a negative supply, the output voltage must be diode clamped to ground.
5.0 PACKAGING INFORMATION

5.1 Package Marking Information

**Legend:**

- XX...X  Product code or customer-specific information
- Y  Year code (last digit of calendar year)
- YY  Year code (last 2 digits of calendar year)
- WW  Week code (week of January 1 is week ‘01’)
- NNN  Alphanumeric traceability code
- e3  Pb-free JEDEC® designator for Matte Tin (Sn)
- *  This package is Pb-free. The Pb-free JEDEC designator (e3)
  can be found on the outer packaging for this package.
- ●, ▲, ▼  Pin one index is identified by a dot, delta up, or delta down (triangle mark).

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.

Underbar (_) and/or Overbar (?) symbol may not be to scale.

d) MIC5205-4.0YM5-TR: 150 mA Low-Noise LDO Regulator, 4.0V, –40°C to +125°C, 5-Lead SOT-23, 3k/Reel

e) MIC5205-2.5YM5-TX: 150 mA Low-Noise LDO Regulator, 2.5V, –40°C to +125°C, 5-Lead SOT-23, 3k/Reel (Rev. Pin 1)

**Note 1:** Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Trademarks

The Microchip name and logo, the Microchip logo, AnyRate, AVR, AVR logo, AVR Freaks, BeaconThings, BitCloud, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KEELOQ logo, KeelO logo, Kleer, LANCheck, LINK MD, maXStylus, maTouch, MediaLB, megaAVR, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, Prooch Designer, QTouch, RightTouch, SAM-BA, SpyNIC, SST, SST Logo, SuperFlash, tinyAVR, UNI/O, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, EtherSynch, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and Quiet-Wire are registered trademarks of Microchip Technology Incorporated in the U.S.A.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
