MCP3201
2.7V 12-Bit A/D Converter with SPI™ Serial Interface

Features
- 12-bit resolution
- ±1 LSB max DNL
- ±1 LSB max INL (MCP3201-B)
- ±2 LSB max INL (MCP3201-C)
- On-chip sample and hold
- SPI™ serial interface (modes 0,0 and 1,1)
- Single supply operation: 2.7V - 5.5V
- 100ksps max. sampling rate at \( V_{DD} = 5V \)
- 50ksps max. sampling rate at \( V_{DD} = 2.7V \)
- Low power CMOS technology
- 500 nA typical standby current, 2 µA max.
- 400 µA max. active current at 5V
- Industrial temp range: -40°C to +85°C
- 8-pin MSOP, PDIP, SOIC and TSSOP packages

Applications
- Sensor Interface
- Process Control
- Data Acquisition
- Battery Operated Systems

Description
The Microchip Technology Inc. MCP3201 is a successive approximation 12-bit Analog-to-Digital (A/D) Converter with on-board sample and hold circuitry. The device provides a single pseudo-differential input. Differential Nonlinearity (DNL) is specified at ±1 LSB, and Integral Nonlinearity (INL) is offered in ±1 LSB (MCP3201-B) and ±2 LSB (MCP3201-C) versions. Communication with the device is done using a simple serial interface compatible with the SPI protocol. The device is capable of sample rates of up to 100 kspst at a clock rate of 1.6 MHz. The MCP3201 operates over a broad voltage range (2.7V - 5.5V). Low current design permits operation with typical standby and active currents of only 500 nA and 300 µA, respectively. The device is offered in 8-pin MSOP, PDIP, TSSOP and 150 mil SOIC packages.

**3.0 PIN DESCRIPTIONS**

3.1 **IN+**
Positive analog input. This input can vary from IN- to \( V_{REF} + \text{IN}^{-} \).

3.2 **IN-**
Negative analog input. This input can vary ±100 mV from \( V_{SS} \).

3.3 **Chip Select/Shutdown (CS/SHDN)**
The CS/SHDN pin is used to initiate communication with the device when pulled low and will end a conversion and put the device in low power standby when pulled high. The CS/SHDN pin must be pulled high between conversions.

3.4 **Serial Clock (CLK)**
The SPI clock pin is used to initiate a conversion and to clock out each bit of the conversion as it takes place. See Section 6.2 for constraints on clock speed.

3.5 **Serial Data Output (DOUT)**
The SPI serial data output pin is used to shift out the results of the A/D conversion. Data will always change on the falling edge of each clock as the conversion takes place.

**4.0 DEVICE OPERATION**
The MCP3201 A/D Converter employs a conventional SAR architecture. With this architecture, a sample is acquired on an internal sample/hold capacitor for 1.5 clock cycles starting on the first rising edge of the serial clock after CS has been pulled low. Following this sample time, the input switch of the converter opens and the device uses the collected charge on the internal sample and hold capacitor to produce a serial 12-bit digital output code. Conversion rates of 100 ksps are possible on the MCP3201. See Section 6.2 for information on minimum clock rates. Communication with the device is done using a 3-wire SPI-compatible interface.

4.1 **Analog Inputs**
The MCP3201 provides a single pseudo-differential input. The IN+ input can range from IN- to \( V_{REF} + \text{IN}^{-} \). The IN- input is limited to ±100 mV from the \( V_{SS} \) rail. The IN- input can be used to cancel small signal common-mode noise which is present on both the IN+ and IN- inputs.

For the A/D Converter to meet specification, the charge holding capacitor (\( C_{\text{SAMPLE}} \)) must be given enough time to acquire a 12-bit accurate voltage level during the 1.5 clock cycle sampling period. The analog input model is shown in Figure 4-1.

In this diagram, it is shown that the source impedance (\( R_{S} \)) adds to the internal sampling switch (\( R_{SS} \)) impedance, directly affecting the time that is required to charge the capacitor (\( C_{\text{SAMPLE}} \)). Consequently, a larger source impedance increases the offset, gain, and integral linearity errors of the conversion.

Ideally, the impedance of the signal source should be near zero. This is achievable with an operational amplifier such as the MCP601, which has a closed loop output impedance of tens of ohms. The adverse affects of higher source impedances are shown in Figure 4-2.

If the voltage level of IN+ is equal to or less than IN-, the resultant code will be 000h. If the voltage at IN+ is equal to or greater than \( \left( V_{REF} + (\text{IN}^{-}) \right) - 1 \text{ LSB} \), then the output code will be FFFh. If the voltage level at IN- is more than 1 LSB below \( V_{SS} \), then the voltage level at the IN+ input will have to go below \( V_{SS} \) to see the 000h output code. Conversely, if IN- is more than 1 LSB above \( V_{SS} \), then the FFFh code will not be seen unless the IN+ input level goes above \( V_{REF} \) level.

4.2 **Reference Input**
The reference input (\( V_{REF} \)) determines the analog input voltage range and the LSB size, as shown below.

\[
\text{LSB Size} = \frac{V_{REF}}{4096}
\]

As the reference input is reduced, the LSB size is reduced accordingly. The theoretical digital output code produced by the A/D Converter is a function of the analog input signal and the reference input as shown below.

\[
\text{Digital Output Code} = \frac{4096 \times V_{IN}}{V_{REF}}
\]

where:

\[
V_{IN} = \text{analog input voltage} = V(IN+) - V(IN-)
\]
\[
V_{REF} = \text{reference voltage}
\]

When using an external voltage reference device, the system designer should always refer to the manufacturer’s recommendations for circuit layout. Any instability in the operation of the reference device will have a direct effect on the operation of the A/D Converter.
FIGURE 4-1: Analog Input Model.

FIGURE 4-2: Maximum Clock Frequency vs. Input Resistance (R_s) to maintain less than a 0.1 LSB deviation in INL from nominal conditions.
5.0 SERIAL COMMUNICATIONS

Communication with the device is done using a standard SPI-compatible serial interface. Initiating communication with the MCP3201 begins with the CS going low. If the device was powered up with the CS pin low, it must be brought high and back low to initiate communication. The device will begin to sample the analog input on the first rising edge after CS goes low. The sample period will end in the falling edge of the second clock, at which time the device will output a low null bit. The next 12 clocks will output the result of the conversion with MSB first, as shown in Figure 5-1. Data is always output from the device on the falling edge of the clock. If all 12 data bits have been transmitted and the device continues to receive clocks while the CS is held low, the device will output the conversion result LSB first, as shown in Figure 5-2. If more clocks are provided to the device while CS is still low (after the LSB first data has been transmitted), the device will clock out zeros indefinitely.

* After completing the data transfer, if further clocks are applied with CS low, the A/D Converter will output LSB first data, followed by zeros indefinitely. See Figure below.

** tDATA: during this time, the bias current and the comparator power down and the reference input becomes a high impedance node, leaving the CLK running to clock out the LSB-first data or zeros.

FIGURE 5-1: Communication with MCP3201 using MSB first Format.

FIGURE 5-2: Communication with MCP3201 using LSB first Format.
6.0 APPLICATIONS INFORMATION

6.1 Using the MCP3201 with Microcontroller SPI Ports

With most microcontroller SPI ports, it is required to clock out eight bits at a time. If this is the case, it will be necessary to provide more clocks than are required for the MCP3201. As an example, Figure 6-1 and Figure 6-2 show how the MCP3201 can be interfaced to a microcontroller with a standard SPI port. Since the MCP3201 always clocks data out on the falling edge of clock, the MCU SPI port must be configured to match this operation. SPI Mode 0,0 (clock idles low) and SPI Mode 1,1 (clock idles high) are both compatible with the MCP3201. Figure 6-1 depicts the operation shown in SPI Mode 0,0, which requires that the CLK from the microcontroller idles in the 'low' state. As shown in the diagram, the MSB is clocked out of the A/D Converter on the falling edge of the third clock pulse. After the first eight clocks have been sent to the device, the microcontroller’s receive buffer will contain two unknown bits (the output is at high impedance for the first two clocks), the null bit and the highest order five bits of the conversion. After the second eight clocks have been sent to the device, the MCU receive register will contain the lowest order seven bits and the B1 bit repeated as the A/D Converter has begun to shift out LSB first data with the extra clock. Typical procedure would then call for the lower order byte of data to be shifted right by one bit to remove the extra B1 bit. The B7 bit is then transferred from the high order byte to the lower order byte, and then the higher order byte is shifted one bit to the right as well. Easier manipulation of the converted data can be obtained by using this method.

Figure 6-2 shows the same thing in SPI Mode 1,1 which requires that the clock idles in the high state. As with mode 0,0, the A/D Converter outputs data on the falling edge of the clock and the MCU latches data from the A/D Converter in on the rising edge of the clock.

**FIGURE 6-1:** SPI Communication using 8-bit segments (Mode 0,0: SCLK idles low).

**FIGURE 6-2:** SPI Communication using 8-bit segments (Mode 1,1: SCLK idles high).
6.2 Maintaining Minimum Clock Speed

When the MCP3201 initiates the sample period, charge is stored on the sample capacitor. When the sample period is complete, the device converts one bit for each clock that is received. It is important for the user to note that a slow clock rate will allow charge to bleed off the sample cap while the conversion is taking place. At 85°C (worst case condition), the part will maintain proper charge on the sample capacitor for at least 1.2 ms after the sample period has ended. This means that the time between the end of the sample period and the time that all 12 data bits have been clocked out must not exceed 1.2 ms (effective clock frequency of 10 kHz). Failure to meet this criteria may induce linearity errors into the conversion outside the rated specifications. It should be noted that during the entire conversion cycle, the A/D Converter does not require a constant clock speed or duty cycle, as long as all timing specifications are met.

6.3 Buffering/Filtering the Analog Inputs

If the signal source for the A/D Converter is not a low impedance source, it will have to be buffered or inaccurate conversion results may occur. See Figure 4-2. It is also recommended that a filter be used to eliminate any signals that may be aliased back into the conversion results. This is illustrated in Figure 6-3 where an op amp is used to drive the analog input of the MCP3201. This amplifier provides a low impedance source for the converter input and a low pass filter, which eliminates unwanted high frequency noise.

Low pass (anti-aliasing) filters can be designed using Microchip’s interactive FilterLab™ software. FilterLab will calculate capacitor and resistor values, as well as determine the number of poles that are required for the application. For more information on filtering signals, see the application note AN699 “Anti-Aliasing Analog Filters for Data Acquisition Systems.”

6.4 Layout Considerations

When laying out a printed circuit board for use with analog components, care should be taken to reduce noise wherever possible. A bypass capacitor should always be used with this device and should be placed as close as possible to the device pin. A bypass capacitor value of 1 µF is recommended.

Digital and analog traces should be separated as much as possible on the board and no traces should run underneath the device or the bypass capacitor. Extra precautions should be taken to keep traces with high frequency signals (such as clock lines) as far as possible from analog traces.

Use of an analog ground plane is recommended in order to keep the ground potential the same for all devices on the board. Providing VDD connections to devices in a “star” configuration can also reduce noise by eliminating current return paths and associated errors. See Figure 6-4. For more information on layout tips when using A/D Converter, refer to AN688 “Layout Tips for 12-Bit A/D Converter Applications.”
7.0 PACKAGING INFORMATION

7.1 Package Marking Information

Legend:

- **XX...X** Customer-specific information
- **Y** Year code (last digit of calendar year)
- **YY** Year code (last 2 digits of calendar year)
- **WW** Week code (week of January 1 is week ‘01’)
- **NNN** Alphanumeric traceability code
- **e3** Pb-free JEDEC designator for Matte Tin (Sn)

* This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.
8-Lead Plastic Dual In-Line (P) – 300 mil Body [PDIP]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

**Notes:**
1. Pin 1 visual index feature may vary, but must be located with the hatched area.
2. § Significant Characteristic.
3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" per side.
4. Dimensioning and tolerancing per ASME Y14.5M.
   - BSC: Basic Dimension. Theoretically exact value shown without tolerances.

APPENDIX A: REVISION HISTORY

Revision D (January 2007)
This revision includes updates to the packaging diagrams.
PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Device: MCP3201: 12-Bit A/D Converter w/SPI Interface
         MCP3201T: 12-Bit A/D Converter w/SPI Interface
          (Tape and Reel) (SOIC and TSSOP only)

Temperature Range: I = -40°C to +85°C

Package: MS = Plastic Micro Small Outline (MSOP), 8-lead
          P = Plastic DIP (300 mil Body), 8-lead
          SN = Plastic SOIC (150 mil Body), 8-lead
          ST = Plastic TSSOP (4.4 mm), 8-lead

Examples:
  a) MCP3201-I/P: Industrial Temperature, PDIP package.
  b) MCP3201-I/SN: Industrial Temperature, SOIC package.
  c) MCP3201-I/ST: Industrial Temperature, TSSOP package.
  d) MCP3201-I/MS: Industrial Temperature, MSOP package.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KEELOQ, microID, MPLAB, PIC, PICmicro, PICSTART, PRO MATE, PowerSmart, rfPIC, and SmartShunt are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AmpLab, FilterLab, Migratable Memory, MXDEV, MXLAB, SEEVAL, SmartSensor and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, ECAN, ECONOMONITOR, FanSense, FlexROM, fuzzyLAB, In-Circuit Serial Programming, ICSP, ICEPIC, Linear Active Thermistor, Mindi, MiWi, MPASM, MPLIB, MPLINK, PICkit, PICDEM, PICDEM.net, PICLAB, PICtail, PowerCal, PowerInfo, PowerMate, PowerTool, REAL ICE, rLAB, rfPICDEM, Select Mode, Smart Serial, SmartTel, Total Endurance, UNI/O, WiperLock and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.
