Features:

- Linear Charge Management Controllers:
  - Integrated Pass Transistor
  - Integrated Current Sense
  - Reverse-Blocking Protection
- High-Accuracy Preset Voltage Regulation: ± 0.5%
- Four Selectable Voltage Regulation Options:
  - 4.1V, 4.2V – MCP73861/3
  - 8.2V, 8.4V – MCP73862/4
- Programmable Charge Current: 1.2A Maximum
- Programmable Safety Charge Timers
- Preconditioning of Deeply Depleted Cells
- Automatic End-of-Charge Control
- Optional Continuous Cell Temperature Monitoring
- Charge Status Output for Direct LED Drive
- Fault Output for Direct LED Drive
- Automatic Power-Down
- Thermal Regulation
- Temperature Range: -40°C to +85°C
- Packaging: 16-Pin, 4 x 4 QFN
- 16-Pin SOIC

Applications:

- Lithium-Ion/Lithium-Polymer Battery Chargers
- Personal Data Assistants (PDAs)
- Cellular Telephones
- Hand-Held Instruments
- Cradle Chargers
- Digital Cameras
- MP3 Players

Description:

The MCP7386X family of devices features highly advanced linear charge management controllers for use in space-limited, cost-sensitive applications. The devices combine high-accuracy, constant voltage and current regulation, cell preconditioning, cell temperature monitoring, advanced safety timers, automatic charge termination, internal current sensing, reverse-blocking protection, charge status and fault indication in either a space-saving 16-pin 4 x 4 QFN package, or a 16-pin SOIC package. The MCP7386X provides a complete, fully functional, stand-alone charge management solution with a minimum number of external components.

The MCP73861/3 is intended for applications utilizing single-cell Lithium-Ion or Lithium-Polymer battery packs, while the MCP73862/4 is intended for dual series cell Lithium-Ion or Lithium-Polymer battery packs. The MCP73861/3 has two selectable voltage-regulation options available (4.1V and 4.2V), for use with either coke or graphite anodes and operate with an input voltage range of 4.5V to 12V. The MCP73862/4 has two selectable voltage-regulation options available (8.2V and 8.4V), for use with coke or graphite anodes, and operate with an input voltage range of 8.7V to 12V.

The MCP73861/2 and MCP73863/4 differ only in the function of the charge status output (STAT1) when a charge cycle has been completed. The MCP73861/2 flashes the output, while the MCP73863/4 turns the output off. Refer to Section 5.2.1 “Charge Status Outputs (STAT1, STAT2)”.

The MCP7386X family of devices are fully specified over the ambient temperature range of -40°C to +85°C.

Typical Application

1.2A Lithium-Ion Battery Charger

Functional Block Diagram

Note: Pin numbers shown are for QFN package. Please refer to Section 6.0 “Applications” for details.
1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

- **VDDN**: 13.5V
- **VBATN, VSET, EN, STAT1, STAT2** w.r.t. **VSS**: -0.3 to (VDD + 0.3)V
- **PROG, THREF, THERM, TIMER** w.r.t. **VSS**: -0.3 to 6V
- Maximum Junction Temperature, **TJ**: Internally Limited
- Storage temperature: -65°C to +150°C

ESD protection on all pins:
- Human Body Model (1.5 kΩ in series with 100 pF) ≥ 4 kV
- Machine Model (200 pF, No series resistance) ............300V

† Notice: Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

#### 3.1 Voltage Regulation Selection (VSET)

**MCP73861/3:** Connect VSET to VSS for 4.1V regulation voltage, connect to VDD for 4.2V regulation voltage.

**MCP73862/4:** Connect VSET to VSS for 8.2V regulation voltage, connect to VDD for 8.4V regulation voltage.

#### 3.2 Battery Management Input Supply (VDD2, VDD1)

A supply voltage of \([V_{REG} \text{ (typ.)} + 0.3V]\) to 12V is recommended. Bypass to VSS with a minimum of 4.7 µF. A 1.5 kΩ resistor should be connected from VDD to ground when using disconnectable supplies to force VDD < VBAT when the supply is disconnected and assure low leakage current.

#### 3.3 Battery Management 0V Reference (VSS1, VSS2, VSS3)

Connect to negative terminal of battery and input supply.

#### 3.4 Current Regulation Set (PROG)

Preconditioning, fast and termination currents are scaled by placing a resistor from PROG to VSS.

#### 3.5 Cell Temperature Sensor Bias (THREF)

THREF is a voltage reference to bias external thermistor for continuous cell temperature monitoring and prequalification.

#### 3.6 Cell Temperature Sensor Input (THERM)

THERM is an input for an external thermistor for continuous cell-temperature monitoring and prequalification. Connect to THREF/3 to disable temperature sensing.

#### 3.7 Timer Set

All safety timers are scaled by \(C_{\text{TIMER}}/0.1 \mu F\).

#### 3.8 Battery Charge Control Output (VBAT1, VBAT2)

Connect to positive terminal of battery. Drain terminal of internal P-channel MOSFET pass transistor. Bypass to VSS with a minimum of 4.7 µF to ensure loop stability when the battery is disconnected.

#### 3.9 Battery Voltage Sense (VBAT3)

VBAT3 is a voltage sense input. Connect to positive terminal of battery. A precision internal resistor divider regulates the final voltage on this pin to \(V_{REG}\)
3.10 Logic Enable (EN)
EN is an input to force charge termination, initiate charge, clear faults or disable automatic recharge.

3.11 Fault Status Output (STAT2)
STAT2 is a current-limited, open-drain drive for direct connection to a LED for charge status indication. Alternatively, a pull-up resistor can be applied for interfacing to a host microcontroller.

3.12 Charge Status Output (STAT1)
STAT1 is a current-limited, open-drain drive for direct connection to a LED for charge status indication. Alternatively, a pull-up resistor can be applied for interfacing to a host microcontroller.

3.13 Exposed Pad (EP)
There is an internal electrical connection between the exposed thermal pad and $V_{SS}$. The EP must be connected to the same potential as the $V_{SS}$ pin on the Printed Circuit Board (PCB).
4.0 DEVICE OVERVIEW

The MCP7386X family of devices are highly advanced linear charge management controllers. Refer to the functional block diagram. Figure 4-2 depicts the operational flow algorithm from charge initiation to completion and automatic recharge.

4.1 Charge Qualification and Preconditioning

Upon insertion of a battery, or application of an external supply, the MCP7386X family of devices automatically performs a series of safety checks to qualify the charge. The input source voltage must be above the Under-voltage Lockout (UVLO) threshold, the enable pin must be above the logic-high level and the cell temperature must be within the upper and lower thresholds. The qualification parameters are continuously monitored. Deviation beyond the limits automatically suspends or terminates the charge cycle. The input voltage must deviate below the UVLO stop threshold for at least one clock period to be considered valid.

Once the qualification parameters have been met, the MCP7386X initiates a charge cycle. The charge status output is pulled low throughout the charge cycle (see Table 5-1 for charge status outputs). If the battery voltage is below the preconditioning threshold (VPTH), the MCP7386X preconditions the battery with a trickle-charge. The preconditioning current is set to approximately 10% of the fast charge regulation current. The preconditioning trickle-charge safely replenishes deeply depleted cells and minimizes heat dissipation during the initial charge cycle. If the battery voltage has not exceeded the preconditioning threshold before the preconditioning timer has expired, a fault is indicated and the charge cycle is terminated.

4.2 Constant Current Regulation – Fast Charge

Preconditioning ends, and fast charging begins, when the battery voltage exceeds the preconditioning threshold. Fast charge regulates to a constant current (IREG), which is set via an external resistor connected to the PROG pin. Fast charge continues until the battery voltage reaches the regulation voltage (VREG), or the fast charge timer expires; in which case, a fault is indicated and the charge cycle is terminated.

4.3 Constant Voltage Regulation

When the battery voltage reaches the regulation voltage (VREG), constant voltage regulation begins. The MCP7386X monitors the battery voltage at the VBAT pin. This input is tied directly to the positive terminal of the battery.

The MCP7386X selects the voltage regulation value based on the state of VSET. With VSET tied to VSS, the MCP73861/3 and MCP73862/4 regulate to 4.1V and 8.2V, respectively. With VSET tied to VDD, the MCP73861/3 and MCP73862/4 regulate to 4.2V and 8.4V, respectively.

4.4 Charge Cycle Completion and Automatic Re-Charge

The MCP7386X monitors the charging current during the Constant-voltage regulation mode. The charge cycle is considered complete when the charge current has diminished below approximately 8% of the regulation current (IREG), or the elapsed timer has expired.

The MCP7386X automatically begins a new charge cycle when the battery voltage falls below the recharge threshold (VRTH), assuming all the qualification parameters are met.

4.5 Thermal Regulation

The MCP7386X family limits the charge current based on the die temperature. Thermal regulation optimizes the charge cycle time while maintaining device reliability. If thermal regulation is entered, the timer is automatically slowed down to ensure that a charge cycle will not terminate prematurely. Figure 4-1 depicts the thermal regulation profile.

4.6 Thermal Shutdown

The MCP7386X family suspends charge if the die temperature exceeds 155°C. Charging will resume when the die temperature has cooled by approximately 10°C. The thermal shutdown is a secondary safety feature in the event that there is a failure within the thermal regulation circuitry.
FIGURE 4-2: Operational Flow Algorithm.
5.0 DETAILED DESCRIPTION

5.1 Analog Circuitry

5.1.1 BATTERY MANAGEMENT INPUT SUPPLY (VDD1, VDD2)

The VDD input is the input supply to the MCP7386X. The MCP7386X automatically enters a Power-down mode if the voltage on the VDD input falls below the UVLO voltage (VSTOP). This feature prevents draining the battery pack when the VDD supply is not present. The VDD inputs should be tied to ground with a resistor ≤ 1.5 kΩ to prevent VDD from floating and staying at VBAT level if the input supply is disconnected. The resistor will assure that VDD < VBAT when the input supply is removed.

5.1.2 PROG INPUT

Fast charge current regulation can be scaled by placing a programming resistor (RPROG) from the PROG input to VSS. Connecting the PROG input to VSS allows for a maximum fast charge current of 1.2A typically. The minimum fast charge current is 100 mA, set by letting the PROG input float. The following formula calculates the value for RPROG:

\[ R_{PROG} = \frac{13.2 - 11 \times I_{REG}}{I_{2} \times I_{REG} - 1.2} \]

Where:
- \( I_{REG} \) = the desired fast charge current in amps.
- \( R_{PROG} \) = measured in kΩ.

The preconditioning trickle-charge current and the charge termination current are scaled to approximately 10% and 8% of \( I_{REG} \) respectively.

5.1.3 CELL TEMPERATURE SENSOR BIAS (THREF)

A 2.5V voltage reference is provided to bias an external thermistor for continuous cell temperature monitoring and prequalification. A ratio metric window comparison is performed at threshold levels of \( V_{THREF}/2 \) and \( V_{THREF}/4 \).

5.1.4 CELL TEMPERATURE SENSOR INPUT (THERM)

The MCP73861/2/3/4 continuously monitors temperature by comparing the voltage between the THERM input and VSS with the upper and lower temperature thresholds. A negative or positive temperature coefficient, NTC or PTC thermistor and an external voltage-divider typically develop this voltage. The temperature sensing circuit has its own reference to which it performs a ratio metric comparison. Therefore, it is immune to fluctuations in the supply input (VDD). The temperature-sensing circuit is removed from the system when VDD is not applied, eliminating additional discharge of the battery pack.

Figure 6-1 depicts a typical application circuit with connection of the THERM input. The resistor values of \( R_{T1} \) and \( R_{T2} \) are calculated with the following equations.

For NTC thermistors:

\[
R_{T1} = \frac{2 \times R_{COLD} \times R_{HOT}}{R_{COLD} - R_{HOT}} \\
R_{T2} = \frac{2 \times R_{COLD} \times R_{HOT}}{R_{COLD} - 3 \times R_{HOT}}
\]

For PTC thermistors:

\[
R_{T1} = \frac{2 \times R_{COLD} \times R_{HOT}}{R_{HOT} - R_{COLD}} \\
R_{T2} = \frac{2 \times R_{COLD} \times R_{HOT}}{R_{HOT} - 3 \times R_{COLD}}
\]

Where:
- \( R_{COLD} \) and \( R_{HOT} \) are the thermistor resistance values at the temperature window of interest.

Applying a voltage equal to \( V_{THREF}/3 \) to the THERM input disables temperature monitoring.

5.1.5 TIMER SET INPUT (TIMER)

The TIMER input programs the period of the safety timers by placing a timing capacitor (CTIMER) between the TIMER input pin and VSS. Three safety timers are programmed via the timing capacitor.

The preconditioning safety timer period:

\[ t_{PRECON} = \frac{C_{TIMER}}{0.1 \mu F} \times 1.0 \text{Hours} \]

The fast charge safety timer period:

\[ t_{FAST} = \frac{C_{TIMER}}{0.1 \mu F} \times 1.5 \text{Hours} \]

The elapsed time termination period:

\[ t_{TERM} = \frac{C_{TIMER}}{0.1 \mu F} \times 3.0 \text{Hours} \]

The preconditioning timer starts after qualification and resets when the charge cycle transitions to the fast charge, Constant-current mode. The fast charge timer and the elapsed timer start once the MCP7386X transitions from preconditioning. The fast charge timer resets when the charge cycle transitions to the Constant-voltage mode. The elapsed timer will expire and terminate the charge if the sensed current does not diminish below the termination threshold.
During thermal regulation, the timer is slowed down proportional to the charge current.

5.1.6 BATTERY VOLTAGE SENSE (VBAT3)
The MCP7386X monitors the battery voltage at the VBAT3 pin. This input is tied directly to the positive terminal of the battery pack.

5.1.7 BATTERY CHARGE CONTROL OUTPUT (VBAT1, VBAT2)
The battery charge control output is the drain terminal of an internal P-channel MOSFET. The MCP7386X provides constant current and voltage regulation to the battery pack by controlling this MOSFET in the linear region. The battery charge control output should be connected to the positive terminal of the battery pack.

5.2 Digital Circuitry

5.2.1 CHARGE STATUS OUTPUTS (STAT1, STAT2)
Two status outputs provide information on the state of charge. The current-limited, open-drain outputs can be used to illuminate external LEDs. Optionally, a pull-up resistor can be used on this output for communication with a host microcontroller. Table 5-1 summarizes the state of the status outputs during a charge cycle.

### TABLE 5-1: STATUS OUTPUTS

<table>

<td>Off</td>
<td>Off</td>
</tr>
</tbody>
</table>

**Legend:**
- Off state: Open-drain is high-impedance.
- On state: Open-drain can sink current typically 7 mA.
- Flashing: Toggles between off state and on state.

The flashing rate (1 Hz) is based off a timer capacitor (CTIMER) of 0.1 µF. The rate will vary based on the value of the timer capacitor.

During a Fault condition, the STAT1 status output will be off and the STAT2 status output will be on. To recover from a Fault condition, the input voltage must be removed and then reapplied, or the enable input (EN) must be de-asserted to a logic-low, then asserted to a logic-high.

When the voltage on the THERM input is outside the preset window, the charge cycle will not start, or will be suspended. The charge cycle is not terminated and recovery is automatic. The charge cycle will resume (or start) once the THERM input is valid and all other qualification parameters are met. During an invalid THERM condition, the STAT1 status output will be off and the STAT2 status output will flash.

5.2.2 VSET INPUT
The VSET input selects the regulated output voltage of the MCP7386X. With VSET tied to VSS, the MCP73861/3 and MCP73862/4 regulate to 4.1V and 8.2V, respectively. With VSET tied to VDD, the MCP73861/3 and MCP73862/4 regulate to 4.2V and 8.4V, respectively.

5.2.3 LOGIC ENABLE (EN)
The logic enable input pin (EN) can be used to terminate a charge at any time during the charge cycle, as well as to initiate a charge cycle or initiate a recharge cycle.

Applying a logic-high input signal to the EN pin, or tying it to the input source, enables the device. Applying a logic-low input signal disables the device and terminates a charge cycle. When disabled, the device’s supply current is reduced to 0.17 µA, typically.
6.0 APPLICATIONS

The MCP7386X is designed to operate in conjunction with a host microcontroller or in stand-alone applications. The MCP7386X provides the preferred charge algorithm for Lithium-Ion and Lithium-Polymer cells: Constant-current followed by Constant-voltage.

Figure 6-1 illustrates a typical stand-alone application circuit, while Figures 6-2 and 6-3 illustrate the accompanying charge profile.

![Typical Application Circuit](image)

**FIGURE 6-1:** Typical Application Circuit.

![Typical Charge Profile](image)

**FIGURE 6-2:** Typical Charge Profile.
6.1 Application Circuit Design

Due to the low efficiency of linear charging, the most important factors are thermal design and cost, which are a direct function of the input voltage, output current and thermal impedance between the battery charger and the ambient cooling air. The worst-case situation is when the device has transitioned from the Preconditioning mode to the Constant-current mode. In this situation, the battery charger has to dissipate the maximum power. A trade-off must be made between the charge current, cost and thermal requirements of the charger.

6.1.1 COMPONENT SELECTION

Selection of the external components in Figure 6-1 is crucial to the integrity and reliability of the charging system. The following discussion is intended as a guide for the component selection process.

6.1.1.1 Current Programming Resistor ($R_{PROG}$)

The preferred fast charge current for Lithium-Ion cells is at the 1C rate, with an absolute maximum current at the 2C rate. For example, a 500 mAh battery pack has a preferred fast charge current of 500 mA. Charging at this rate provides the shortest charge cycle times without degradation to the battery pack performance or life.

1200 mA is the maximum charge current obtainable from the MCP7386X. For this situation, the PROG input should be connected directly to $V_{SS}$.

6.1.1.2 Thermal Considerations

The worst-case power dissipation in the battery charger occurs when the input voltage is at the maximum and the device has transitioned from the Preconditioning mode to the Constant-current mode. In this case, the power dissipation is:

$$\text{PowerDissipation} = (V_{DDMAX} - V_{PTHMIN}) \times I_{REGMAX}$$

Where:

- $V_{DDMAX}$ = the maximum input voltage
- $I_{REGMAX}$ = the maximum fast charge current
- $V_{PTHMIN}$ = the minimum transition threshold voltage

FIGURE 6-3: Typical Charge Profile in Thermal Regulation.
Power dissipation with a 5V, ±10% input voltage source is:

\[ PowerDissipation = (5.5V - 2.7V) \times 575mA = 1.61W \]

With the battery charger mounted on a 1 in² pad of 1 oz. copper, the junction temperature rise is 60°C, approximately. This would allow for a maximum operating ambient temperature of 50°C before thermal regulation is entered.

6.1.1.3 External Capacitors

The MCP7386X is stable with or without a battery load. In order to maintain good AC stability in the Constant-voltage mode, a minimum capacitance of 4.7 µF is recommended to bypass the V\text{BAT} pin to V\text{SS}. This capacitance provides compensation when there is no battery load. In addition, the battery and interconnections appear inductive at high frequencies. These elements are in the control feedback loop during Constant-voltage mode. Therefore, the bypass capacitance may be necessary to compensate for the inductive nature of the battery pack.

Virtually any good quality output filter capacitor can be used, independent of the capacitor’s minimum Effective Series Resistance (ESR) value. The actual value of the capacitor (and its associated ESR) depends on the output load current. A 4.7 µF ceramic, tantalum or aluminum electrolytic capacitor at the output is usually sufficient to ensure stability for up to a 1A output current.

6.1.1.4 Reverse-Blocking Protection

The MCP7386X provides protection from a faulted or shorted input, or from a reversed-polarity input source. Without the protection, a faulted or shorted input would discharge the battery pack through the body diode of the internal pass transistor.

6.1.1.5 Enable Interface

In the stand-alone configuration, the enable pin is generally tied to the input voltage. The MCP7386X automatically enters a Low-power mode when voltage on the V\text{DD} input falls below the UVLO voltage (V\text{STOP}), reducing the battery drain current to 0.23 µA, typically.

6.1.1.6 Charge Status Interface

Two status outputs provide information on the state of charge. The current-limited, open-drain outputs can be used to illuminate external LEDs. Refer to Table 5-1 for a summary of the state of the status outputs during a charge cycle.

6.2 PCB Layout Issues

For optimum voltage regulation, place the battery pack as close as possible to the device’s V\text{BAT} and V\text{SS} pins, recommended to minimize voltage drops along the high current-carrying PCB traces.

If the PCB layout is used as a heatsink, adding many vias in the heatsink pad can help conduct more heat to the backplane of the PCB, thus reducing the maximum junction temperature.
7.0 PACKAGING INFORMATION

7.1 Package Marking Information

Legend:

- **XX...X** Customer-specific information
- **Y** Year code (last digit of calendar year)
- **YY** Year code (last 2 digits of calendar year)
- **WW** Week code (week of January 1 is week ‘01’)
- **NNN** Alphanumeric traceability code
- **e3** Pb-free JEDEC designator for Matte Tin (Sn)
- ***** This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

Microchip Technology Drawing No. C04-2108A
APPENDIX A: REVISION HISTORY

Revision F (March 2013)
The following is the list of modifications:
1. Added the Output Reverse Leakage Switchover Time parameter to the DC Characteristics table.
2. Updated Section 3.2.
3. Updated Section 5.1.1.
4. Updated Figure 6-1.

Revision E (April 2011)
The following is the list of modifications:
1. Updated Figure 2-4.

Revision D (December 2008)
The following is the list of modifications:
1. Updated package outline diagrams.

Revision C (August 2005)
The following is the list of modifications:
1. Added MCP73863 and MCP73864 devices throughout data sheet.
2. Added Appendix A: Revision History.
3. Updated QFN and SOIC package diagrams.

Revision B (December 2004)
The following is the list of modifications:
Added SOIC package throughout data sheet.

Revision A (June 2004)
Original Release of this Document.

c) MCP73864-I/SL: Dual-Cell Controller 16LD-SOIC package.
d) MCP73864T-I/SL: Dual-Cell Controller 16LD-SOIC package.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Microchip makes no representations or warranties of any kind whether express or implied, written or oral, statutory or otherwise, related to the information, including but not limited to its condition, quality, performance, merchantability or fitness for purpose. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks
The Microchip name and logo, dsPIC, FlashFlex, KEELOQ, KEELOQ logo, MPLAB, PIC, PICmicro, PICSTART, PIC32 logo, rPIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.
FilterLab, Hampshire, Hi-TECH C, Linear Active Thermistor, MTP, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.
Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.
Analog-for-the-Digital Age, Application Maestro, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MFP, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Omniscient Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICKit, PICtail, REAL ICE, rFLAB, Select Mode, SQI, Serial Quad I/O, Total Endurance, TSHARC, UniWinDriver, WiperLock, ZENA and Z-Scale are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.
SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.
GestIC and ULPP are registered trademarks of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949 ==

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
