MCP9804

±0.25°C Typical Accuracy Digital Temperature Sensor

Features

- **Accuracy:**
  - ±0.25°C (typical) from -40°C to +125°C
  - ±1°C (maximum) from -40°C to +125°C
  - +0.05°C (typical) lifetime drift
  - ±0.0625°C or ±1 LSb (typical) repeatability
- **User-Selectable Measurement Resolution:**
  - +0.5°C, +0.25°C, +0.125°C, +0.0625°C
- **User-Programmable Temperature Limits:**
  - Temperature Window Limit
  - Critical Temperature Limit
- **User-Programmable Temperature Alert Output**
- Operating Voltage Range: 2.7V to 5.5V
- Operating Current: 200 µA (typical)
- Shutdown Current: 0.1 µA (typical)
- 2-wire Interface: I²C™/SMBus Compatible
- Available Packages: 2x3 DFN-8, MSOP-8

Typical Applications

- General Purpose
- Industrial Applications
- Industrial Freezers and Refrigerators
- Food Processing
- Personal Computers and Servers
- PC Peripherals
- Consumer Electronics
- Handheld/Portable Devices

Temperature Accuracy

- Temperature Accuracy:
  - TA = -40°C to +125°C
  - VDD = 3.3V
  - 2787 units

Description

Microchip Technology Inc.’s MCP9804 digital temperature sensor converts temperatures between -40°C and +125°C to a digital word with ±0.25°C/±1°C (typical/maximum) accuracy.

The MCP9804 comes with user-programmable registers that provide flexibility to temperature sensing applications. The registers allow user-selectable settings such as Shutdown or Low-Power modes and the specification of temperature Alert window limits and critical output limits. When the temperature changes beyond the specified boundary limits, the MCP9804 outputs an Alert signal. The user has the option of setting the Alert output signal polarity as an active-low or active-high comparator output for thermostat operation, or as a temperature Alert interrupt output for microprocessor-based systems. The Alert output can also be configured as a critical temperature output only.

This sensor has an industry standard 100 kHz, 2-wire, SMBus/I²C compatible serial interface, allowing up to eight or sixteen sensors to be controlled with a single serial bus (see Table 3-2 for available Address codes). These features make the MCP9804 ideal for sophisticated, multi-zone, temperature-monitoring applications.

†Notice: Stresses above those listed under “Maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TEMPERATURE SENSOR DC CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, VDD = 2.7V to 5.5V, GND = Ground and TA = -40°C to +125°C.

</tbody>
</table>

Note 1: All values referred to $V_{IL \text{ MAX}}$ and $V_{IH \text{ MIN}}$ levels.

2: If $t_{LOW} > t_{OUT}$ or $t_{HIGH} > t_{OUT}$, the temperature sensor i²C interface will time-out. A Repeat Start command is required for communication.

3: This device can be used in a Standard-mode i²C-bus system, but the requirement $t_{SU-DI \text{ MIN}}$ must be met. This device does not stretch SCL Low time.

4: As a transmitter, the device provides internal minimum delay time $t_{HD-DO \text{ MIN}}$, to bridge the undefined region of the falling edge of SCL $t_{F \text{ MAX}}$ to avoid unintended generation of Start or Stop conditions.

5: As a receiver, SDA should not be sampled at the falling edge of SCL. SDA can transition $t_{HD-DI}$ after SCL toggles Low.

6: The i²C Fast Mode specification, or timing for bus frequency up to 400KHz, applies to devices starting with date code of 1145.

### 3.1 Address Pins (A0, A1, A2)

These pins are device address input pins.

The address pins correspond to the Least Significant bits (LSbs) of the address bits and the Most Significant bits (MSbs): A6, A5, A4, A3. This is shown in Table 3-2.

### TABLE 3-2: MCP9804 ADDRESS BYTE

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Note 1: User-selectable address is shown by ‘x’. A2, A1 and A0 must match the corresponding device pin configuration.

Note 2: Contact factory for this address code.

### 3.2 Ground Pin (GND)

The GND pin is the system ground pin.

### 3.3 Serial Data Line (SDA)

SDA is a bidirectional input/output pin, used to serially transmit data to/from the host controller. This pin requires a pull-up resistor. (See Section 4.0 “Serial Communication”.)

### 3.4 Serial Clock Line (SCL)

The SCL is a clock input pin. All communication and timing is relative to the signal on this pin. The clock is generated by the host or master controller on the bus. (See Section 4.0 “Serial Communication”.)

### 3.5 Temperature Alert, Open-Drain Output (Alert)

The MCP9804 temperature Alert output pin is an open-drain output. The device outputs a signal when the ambient temperature goes beyond the user-programmed temperature limit. (See Section 5.2.3 “Alert Output Configuration”.)

### 3.6 Power Pin (VDD)

VDD is the power pin. The operating voltage range, as specified in the DC electrical specification table, is applied on this pin.

### 3.7 Exposed Thermal Pad (EP)

There is an internal electrical connection between the Exposed Thermal Pad (EP) and the GND pin. The EP may be connected to the system ground on the Printed Circuit Board (PCB).
4.0 SERIAL COMMUNICATION

4.1 2-Wire Standard Mode I²C™ Protocol Compatible Interface

The MCP9804 Serial Clock (SCL) input and the bidirectional Serial Data (SDA) line form a 2-wire bidirectional, Standard mode, I²C compatible communication port (refer to the Digital Input/Output Pin Characteristics and Sensor Serial Interface Timing Specifications tables).

The following bus protocol has been defined:

**TABLE 4-1: MCP9804 SERIAL BUS PROTOCOL DESCRIPTIONS**

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master</td>
<td>The device that controls the serial bus, typically a microcontroller.</td>

<td>A receiver Not-Acknowledges (NAK) or releases the bus to show End-of-Data</td>
</tr>
<tr>
<td>Busy</td>
<td>Communication is not possible because the bus is in use.</td>
</tr>
<tr>
<td>Not Busy</td>
<td>The bus is in the Idle state; both SDA and SCL remain high.</td>
</tr>
<tr>
<td>Data Valid</td>
<td>SDA must remain stable before SCL becomes high in order for a data bit to</td>
</tr>
<tr>
<td></td>
<td>be considered valid. During normal data transfers, SDA only changes state</td>
</tr>
<tr>
<td></td>
<td>while SCL is low.</td>
</tr>
</tbody>
</table>

4.1.1 DATA TRANSFER

Data transfers are initiated by a Start condition (START), followed by a 7-bit device address and a read/write bit. An Acknowledge (ACK) from the slave confirms the reception of each byte. Each access must be terminated by a Stop condition (STOP). Repeated communication is initiated after tB-FREE.

This device does not support sequential register read/write. Each register needs to be addressed using the Register Pointer.

This device supports the receive protocol. The register can be specified using the pointer for the initial read. Each repeated read or receive begins with a Start condition and address byte. The MCP9804 retains the previously selected register. Therefore, it outputs data from the previously specified register (repeated pointer specification is not necessary).

4.1.2 MASTER/SLAVE

The bus is controlled by a master device (typically a microcontroller) that controls the bus access and generates the Start and Stop conditions. The MCP9804 is a slave device and does not control other devices in the bus. Both master and slave devices can operate as either transmitter or receiver. However, the master device determines which mode is activated.

4.1.3 START/STOP CONDITION

A high-to-low transition of the SDA line (while SCL is high) is the Start condition. All data transfers must be preceded by a Start condition from the master. A low-to-high transition of the SDA line (while SCL is high) signifies a Stop condition.

If a Start or Stop condition is introduced during data transmission, the MCP9804 releases the bus. All data transfers are ended by a Stop condition from the master.
4.1.4 ADDRESS BYTE
Following the Start condition, the host must transmit an 8-bit address byte to the MCP9804. The address for the MCP9804 temperature sensor is ‘0011, A2, A1, A0’ in binary, where the A2, A1 and A0 bits are set externally by connecting the corresponding pins to VDD ‘1’ or GND ‘0’. The 7-bit address, transmitted in the serial bit stream, must match the selected address for the MCP9804 to respond with an ACK. Bit 8 in the address byte is a read/write bit. Setting this bit to ‘1’ commands a read operation, while ‘0’ commands a write operation (see Figure 4-1).

FIGURE 4-1: Device Addressing.

4.1.5 DATA VALID
After the Start condition, each bit of data in the transmission needs to be settled for a time specified by tSU-DATA before SCL toggles from low-to-high (see the Sensor Serial Interface Timing Specifications section).

4.1.6 ACKNOWLEDGE (ACK/NAK)
Each receiving device, when addressed, must generate an ACK bit after the reception of each byte. The master device must generate an extra clock pulse for ACK to be recognized.

The Acknowledging device pulls down the SDA line for tSU-DATA before the low-to-high transition of SCL from the master. SDA also needs to remain pulled down for tH-DATA after a high-to-low transition of SCL.

During read, the master must signal an End-of-Data (EOD) to the slave by not generating an ACK bit (NAK), once the last bit has been clocked out of the slave. In this case, the slave will leave the data line released to enable the master to generate the Stop condition.

4.1.7 TIME-OUT
If the SCL stays low or high for the time specified by tOUT, the MCP9804 temperature sensor resets the serial interface. This dictates the minimum clock speed as outlined in the specification.
5.0 FUNCTIONAL DESCRIPTION

The MCP9804 temperature sensors consist of a band-gap-type temperature sensor, a Delta-Sigma Analog-to-Digital Converter (ΔΣ ADC), user-programmable registers and a 2-wire SMBus/I2C protocol compatible serial interface. Figure 5-1 shows a block diagram of the register structure.
5.1 Registers

The MCP9804 has several registers that are user-accessible. These registers include the Temperature register, Configuration register, Temperature Alert Upper Boundary and Lower Boundary Limit registers, Critical Temperature Limit register, Manufacturer Identification register and Device Identification register.

The Temperature register is read-only, used to access the ambient temperature data. This register is double-buffered and it is updated every \( t_{CONV} \). The Temperature Alert Upper Boundary and Lower Boundary Limit registers are read/write registers. If the ambient temperature drifts beyond the user-specified limits, the MCP9804 outputs a signal using the Alert pin (refer to Section 5.2.3 “Alert Output Configuration”). In addition, the Critical Temperature Limit register is used to provide an additional critical temperature limit.

The Configuration register provides access to configure the MCP9804 device’s various features. These registers are described in further detail in the following sections.

The registers are accessed by sending a Register Pointer to the MCP9804, using the serial interface. This is an 8-bit write-only pointer. However, the four Least Significant bits are used as pointers and all unused bits (Register Pointer<7:4>) need to be cleared or set to ‘0’. Register 5-1 describes the pointer or the address of each register.

5.1.1 SENSOR CONFIGURATION REGISTER (CONFIG)

The MCP9804 has a 16-bit Configuration register (CONFIG) that allows the user to set various functions for a robust temperature monitoring system. Bits 10 through 0 are used to select the temperature alert output hysteresis, device shutdown or Low-Power mode, temperature boundary and critical temperature lock, and temperature Alert output enable/disable. In addition, Alert output condition (output set for \(T_{\text{UPPER}}\) and \(T_{\text{LOWER}}\) temperature boundary or \(T_{\text{CRIT}}\) only), Alert output status and Alert output polarity and mode (Comparator Output or Interrupt Output mode) are user-configurable.

The temperature hysteresis bits 10 and 9 can be used to prevent output chatter when the ambient temperature gradually changes beyond the user-specified temperature boundary (see Section 5.2.2 “Temperature Hysteresis (\(T_{\text{HYST}}\))”). The Continuous Conversion or Shutdown mode is selected using bit 8. In Shutdown mode, the band gap temperature sensor circuit stops converting temperature and the Ambient Temperature register (\(T_A\)) holds the previous temperature data (see Section 5.2.1 “Shutdown Mode”). Bits 7 and 6 are used to lock the user-specified boundaries \(T_{\text{UPPER}}, T_{\text{LOWER}}\) and \(T_{\text{CRIT}}\) to prevent an accidental rewrite. The Lock bits are cleared by resetting the power. Bits 5 through 0 are used to configure the temperature Alert output pin. All functions are described in Register 5-2 (see Section 5.2.3 “Alert Output Configuration”).

</tbody>
</table>

In shutdown, all power-consuming activities are disabled, though all registers can be written to or read. This bit cannot be set to ‘1’ when either of the Lock bits is set (bit 6 and bit 7). However, it can be cleared to ‘0’ for continuous conversion while locked (refer to Section 5.2.1 “Shutdown Mode”).
REGISTER 5-2: CONFIG: CONFIGURATION REGISTER (→ ADDRESS ‘0000 0001’B)

bit 7  Crit. Lock: TCRIT Lock bit
0 = Unlocked. TCRIT register can be written (power-up default)
1 = Locked. TCRIT register can not be written
When enabled, this bit remains set to ‘1’ or locked until cleared by an internal Reset (Section 5.3 “Summary of Power-on Default”). This bit does not require a double-write.
This bit can be programmed in Shutdown mode.

bit 6  Win. Lock: TUPPER and TCLower Window Lock bit
0 = Unlocked; TUPPER and TCLower registers can be written (power-up default)
1 = Locked; TUPPER and TCLower registers can not be written
When enabled, this bit remains set to ‘1’ or locked until cleared by a Power-on Reset (Section 5.3 “Summary of Power-on Default”). This bit does not require a double-write.
This bit can be programmed in Shutdown mode.

bit 5  Int. Clear: Interrupt Clear bit
0 = No effect (power-up default)
1 = Clear interrupt output; when read, this bit returns to ‘0’
This bit can not be set to ‘1’ in Shutdown mode, but it can be cleared after the device enters Shutdown mode.

bit 4  Alert Stat.: Alert Output Status bit
0 = Alert output is not asserted by the device (power-up default)
1 = Alert output is asserted as a comparator/Interrupt or critical temperature output
This bit can not be set to ‘1’ or cleared to ‘0’ in Shutdown mode. However, if the Alert output is configured as Interrupt mode, and if the host controller clears to ‘0’, the interrupt, using bit 5 while the device is in Shutdown mode, then this bit will also be cleared ‘0’.

bit 3  Alert Cnt.: Alert Output Control bit
0 = Disabled (power-up default)
1 = Enabled
This bit can not be altered when either of the Lock bits are set (bit 6 and bit 7).
This bit can be programmed in Shutdown mode, but the Alert output will not assert or deassert.

bit 2  Alert Sel.: Alert Output Select bit
0 = Alert output for TUPPER, TCLower and TCRIT (power-up default)
1 = TA > TCRIT only (TUPPER and TCLower temperature boundaries are disabled)
When the Alarm Window Lock bit is set, this bit cannot be altered until unlocked (bit 6).
This bit can be programmed in Shutdown mode, but the Alert output will not assert or deassert.

bit 1  Alert Pol.: Alert Output Polarity bit
0 = Active-low (power-up default; pull-up resistor required)
1 = Active-high
This bit can not be altered when either of the Lock bits are set (bit 6 and bit 7).
This bit can be programmed in Shutdown mode, but the Alert output will not assert or deassert.

bit 0  Alert Mod.: Alert Output Mode bit
0 = Comparator output (power-up default)
1 = Interrupt output
This bit can not be altered when either of the Lock bits are set (bit 6 and bit 7).
This bit can be programmed in Shutdown mode, but the Alert output will not assert or deassert.
Writing to the CONFIG Register to Enable the Event Output Pin \(<0000\ 0000\ 0000\ 1000>b\):

**FIGURE 5-2:** Timing Diagram for Writing to the Configuration Register (see Section 4.0 “Serial Communication”).

Note: This is an example routine (see Appendix A: “Source Code”).

```c
i2c_start(); // send START command
i2c_write(AddressByte & 0xFE); // WRITE Command (see Section 4.1.4 “Address Byte”)  
// also, make sure bit 0 is cleared '0'
i2c_write(0x01); // Write CONFIG Register
i2c_write(0x00); // Write data
i2c_write(0x08); // Write data
i2c_stop(); // send STOP command
```
Reading the CONFIG Register:

![Timing Diagram for Reading from the Configuration Register](image)

Note: It is not necessary to select the Register Pointer if it was set from the previous read/write.

Note: This is an example routine (see Appendix A: “Source Code”).

```c
i2c_start(); // send START command
i2c_write(AddressByte & 0xFE); //WRITE Command (see Section 4.1.4 “Address Byte”)  
//also, make sure bit 0 is cleared '0'
i2c_write(0x01); // Write CONFIG Register
i2c_start(); // send Repeat START command
i2c_write(AddressByte | 0x01); //READ Command  
//also, make sure bit 0 is set '1'
UpperByte = i2c_read(ACK); // READ 8 bits  
//and Send ACK bit
LowerByte = i2c_read(NAK); // READ 8 bits  
//and Send NAK bit
i2c_stop(); // send STOP command
```

**FIGURE 5-3:** Timing Diagram for Reading from the Configuration Register (see Section 4.0 “Serial Communication”).
5.1.2 UPPER/LOWER/CRITICAL TEMPERATURE LIMIT REGISTERS (T\text{UPPER}/T\text{LOWER}/T\text{CRIT})

The MCP9804 has a 16-bit read/write Alert Output Temperature Upper Boundary register (T\text{UPPER}), a 16-bit Lower Boundary register (T\text{LOWER}) and a 16-bit Critical Boundary register (T\text{CRIT}) that contain 11-bit data in two's complement format (0.25°C). This data represents the maximum and minimum temperature boundary or temperature window that can be used to monitor ambient temperature. If this feature is enabled (Section 5.1.1 “Sensor Configuration Register (CONFIG)”) and the ambient temperature exceeds the specified boundary or window, the MCP9804 asserts an Alert output. (Refer to Section 5.2.3 “Alert Output Configuration”).

FIGURE 5-4: Timing Diagram for Writing and Reading from the $T_{UPPER}$ Register (see Section 4.0 “Serial Communication”).

Writing +90°C to the $T_{UPPER}$ Register $<0000 0101 1010 0000>_b$:

Reading from the $T_{UPPER}$ Register:

Note: It is not necessary to select the Register Pointer if it was set from the previous read/write.
5.1.3 AMBIENT TEMPERATURE REGISTER (TA)

The MCP9804 uses a band gap temperature sensor circuit to output analog voltage proportional to absolute temperature. An internal ΔΣ ADC is used to convert the analog voltage to a digital word. The digital word is loaded to a 16-bit read-only Ambient Temperature register (TA) that contains 13-bit temperature data in two’s complement format.

The TA register bits (TA<12:0>) are double-buffered. Therefore, the user can access the register, while in the background, the MCP9804 performs an Analog-to-Digital conversion. The temperature data from the ΔΣ ADC is loaded in parallel to the TA register at tCONV refresh rate.

In addition, the TA register uses three bits (TA<15:13>) to reflect the Alert pin state. This allows the user to identify the cause of the Alert output trigger (see Section 5.2.3 “Alert Output Configuration”); bit 15 is set to ‘1’ if TA is greater than or equal to TCRIT, bit 14 is set to ‘1’ if TA is greater than TUPPER and bit 13 is set to ‘1’ if TA is less than TLOWER.

The TA register bit assignment and boundary conditions are described in Register 5-4.

In addition, the TA register uses three bits (TA<15:13>) to reflect the Alert pin state. This allows the user to identify the cause of the Alert output trigger (see Section 5.2.3 “Alert Output Configuration”); bit 15 is set to ‘1’ if TA is greater than or equal to TCRIT, bit 14 is set to ‘1’ if TA is greater than TUPPER and bit 13 is set to ‘1’ if TA is less than TLOWER.

The TA register bit assignment and boundary conditions are described in Register 5-4.

   1 = TA < 0°C

5. TA: Ambient Temperature bits(2)
   
   12-bit ambient temperature data in two’s complement format.

**Note 1:** Bits 15, 14 and 13 are not affected by the status of the Alert Output Configuration (CONFIG<5:0>) bits, Register 5-2).

2. Bits 2, 1 and 0 may remain clear at ‘0’ depending on the status of the Resolution register (Register 5-7).
   
   The power-up default is 0.25°C/bit; bits 1 and 0 remain clear ‘0’.
5.1.3.1  $T_A$ Bits to Temperature Conversion

To convert the $T_A$ bits to decimal temperature, the upper three boundary bits ($T_A<15:13>$) must be masked out. Then, determine the SIGN bit (bit 12) to check positive or negative temperature, shift the bits accordingly, and combine the upper and lower bytes of the 16-bit register. The upper byte contains data for temperatures greater than +32°C while the lower byte contains data for temperature less than +32°C, including fractional data. When combining the upper and lower bytes, the upper byte must be right-shifted by 4 bits (or multiply by $2^4$) and the lower byte must be left-shifted by 4 bits (or multiply by $2^{-4}$). Adding the results of the shifted values provides the temperature data in decimal format (see Equation 5-1).

The temperature bits are in two’s complement format, therefore, positive temperature data and negative temperature data are computed differently. Equation 5-1 shows the temperature computation. The example instruction code, outlined in Example 5-1, shows the communication flow; also see Figure 5-5 for the timing diagram.

**EQUATION 5-1:  BYTES TO TEMPERATURE CONVERSION**

\[
T_A \geq 0°C \\
T_A = (UpperByte \times 2^4 + LowerByte \times 2^{-4})
\]

Temperature $<0°C$

\[
T_A = 256 - (UpperByte \times 2^4 + LowerByte \times 2^{-4})
\]

Where:

$T_A = \text{Ambient Temperature} (°C)$

UpperByte  = $T_A$ bit 15 to bit 8

LowerByte  = $T_A$ bit 7 to bit 0

**EXAMPLE 5-1:  SAMPLE INSTRUCTION CODE**

This example routine assumes the variables and I2C™ communication subroutines are predefined (see Appendix A: “Source Code”):

```c
// Send START command
i2c_start();

// WRITE Command (see Section 4.1.4 “Address Byte”)  
// also, make sure bit 0 is cleared ‘0’
if((AddressByte & 0xFE) == 0xFE) 
{
    i2c_write(AddressByte & 0xFE);
}

// Write $T_A$ Register Address
i2c_write(0x05);

// Repeat START
i2c_start();

// READ Command (see Section 4.1.4 “Address Byte”)  
// also, make sure bit 0 is set ‘1’
if((AddressByte | 0x01) == 0x06) 
{
    i2c_write(AddressByte | 0x01);
}

// READ 8 bits and Send ACK bit
UpperByte = i2c_read(ACK);

// READ 8 bits and Send NAK bit
LowerByte = i2c_read(NAK);

// Send STOP command
i2c_stop();

// Convert the temperature data
// First Check flag bits
if ((UpperByte & 0x80) == 0x80) // $T_A \geq TC\text{RIT}$
{
    UpperByte = UpperByte & 0x1F; // Clear flag bits
}
if ((UpperByte & 0x40) == 0x40) // $T_A > T\text{UPPER}$
{
    UpperByte = UpperByte & 0x0F; // Clear SIGN
    Temperature = 256 - (UpperByte x 16 + LowerByte / 16);
}
else // $T_A \geq 0°C$
{
    Temperature = (UpperByte x 16 + LowerByte / 16);
    // Temperature = Ambient Temperature (°C)
}
```

5.1.6 RESOLUTION REGISTER

This register allows the user to change the sensor resolution (see Section 5.2.4 “Temperature Resolution”). The POR default resolution is +0.0625°C. The selected resolution is also reflected in the Capability register (see Register 5-2).

**REGISTER 5-7: RESOLUTION REGISTER (→ ADDRESS ‘0000 1000’b)**

- 00 = LSB = +0.5°C (t\text{CONV} = 30 ms typical)
- 01 = LSB = +0.25°C (t\text{CONV} = 65 ms typical)
- 10 = LSB = +0.125°C (t\text{CONV} = 130 ms typical)
- 11 = LSB = +0.0625°C (power-up default, t\text{CONV} = 250 ms typical)

**FIGURE 5-8:** Timing Diagram for Changing \( T_A \) Resolution to +0.0625°C <0000 0011>b (see Section 4.0 “Serial Communication”).
5.2 SENSOR FEATURE DESCRIPTION

5.2.1 SHUTDOWN MODE
Shutdown mode disables all power consuming activities (including temperature sampling operations) while leaving the serial interface active. This mode is selected by setting bit 8 of CONFIG to ‘1’. In this mode, the device consumes $I_{SHDN}$. It remains in this mode until bit 8 is cleared to ‘0’ to enable Continuous Conversion mode or until power is recycled.

The Shutdown bit (bit 8) cannot be set to ‘1’ while the CONFIG<7:6> bits (Lock bits) are set to ‘1’. However, it can be cleared to ‘0’ or returned to Continuous Conversion mode while locked.

In Shutdown mode, all registers can be read or written. However, the serial bus activity increases the shutdown current. In addition, if the device is in shutdown while the Alert pin is asserted, the device will retain the active state during shutdown. This increases the shutdown current due to the additional Alert output current.

5.2.2 TEMPERATURE Hysteresis (T_{HYST})
A hysteresis of 0°C, +1.5°C, +3°C or +6°C can be selected for the T_{UPPER}, T_{LOWER} and T_{CRIT} temperate boundaries, using bits 10 and 9 of CONFIG. The hysteresis applies for decreasing temperature only (hot to cold) or as temperature drifts below the specified limit.

The Hysteresis bits can not be changed if either of the Lock bits (CONFIG<7:6>) are set to ‘1’.

The T_{UPPER}, T_{LOWER} and T_{CRIT} boundary conditions are described graphically in Figure 5-10.

5.2.3 ALERT OUTPUT CONFIGURATION
The Alert output can be enabled by using bit 3 of the CONFIG register (Alert Output Control bit) and can be configured as either a comparator output or as an Interrupt Output mode using bit 0 of CONFIG (Alert Output Mode bit). The polarity can also be specified as active-high or active-low using bit 1 of CONFIG (Alert Polarity bit). This is an open-drain output and requires a pull-up resistor.

When the ambient temperature increases above the critical temperature limit, the Alert output is forced to a comparator output (regardless of CONFIG<0>). When the temperature drifts below the critical temperature limit minus hysteresis, the Alert output automatically returns to the state specified by CONFIG<0> bit.

The status of the Alert output can be read using CONFIG<4> (Alert Output Status bit). This bit cannot be set to ‘1’ in Shutdown mode.

Bits 7 and 6 of the CONFIG register can be used to lock the T_{UPPER}, T_{LOWER} and T_{CRIT} registers. These bits prevent false triggers at the Alert output due to an accidental rewrite to these registers.

The Alert output can also be used as a critical temperature output using bit 2 of CONFIG (Alert Output Select bit). When this feature is selected, the Alert output becomes a comparator output. In this mode, the interrupt output configuration (Alert Output Mode bit, CONFIG<0>) is ignored.

5.2.3.1 Comparator Mode
Comparator mode is selected using bit 0 of CONFIG. In this mode, the Alert output is asserted as active-high or active-low, using bit 1 of CONFIG. Figure 5-10 shows the conditions that toggle the Alert output.

If the device enters Shutdown mode with asserted Alert output, the output remains asserted during Shutdown mode. The device must be operating in Continuous Conversion mode for $t_{CONV}$. The $T_A$ vs. $T_{UPPER}$, $T_{LOWER}$ and $T_{CRIT}$ boundary conditions need to be satisfied in order for the Alert output to deassert.

Comparator mode is useful for thermostat type applications, such as turning on a cooling fan or triggering a system shutdown when the temperature exceeds a safe operating range.
5.2.3.2 Interrupt Mode

In Interrupt mode, the Alert output is asserted as active-high or active-low (depending on the polarity configuration) when $T_A$ drifts above or below $T_{\text{UPPER}}$ and $T_{\text{LOWER}}$ limits. The output is deasserted by setting bit 5 (Interrupt Clear bit) of CONFIG. Shutting down the device will not reset or deassert the Alert output. This mode can not be selected when the Alert output is used as a critical temperature output only, using bit 2 of CONFIG.

This mode is designed for interrupt driven microcontroller-based systems. The microcontroller receiving the interrupt will have to Acknowledge the interrupt by setting bit 5 of the CONFIG register from the MCP9804.

5.2.4 TEMPERATURE RESOLUTION

The MCP9804 is capable of providing temperature data with +0.5°C to +0.0625°C resolution. The resolution can be selected using the Resolution register (Register 5-7). It is located at address, '00001000'b, and it provides measurement flexibility. A +0.0625°C resolution is set as a POR default by the factory.

7. $T_A < T_{CRIT} - T_{HYST}$
5.3 Summary of Power-on Default

The MCP9804 has an internal Power-on Reset (POR) circuit. If the power supply voltage, \(V_{DD}\), glitches below the \(V_{POR}\) threshold, the device resets the registers to the power-on default settings.

Table 5-3 shows the power-on default summary for the Temperature Sensor registers.

6.0 APPLICATIONS INFORMATION

6.1 Layout Considerations

The MCP9804 does not require any additional components besides the master controller in order to measure temperature. However, it is recommended that a decoupling capacitor of 0.1 µF to 1 µF be used between the VDD and GND pins. A high-frequency ceramic capacitor is recommended. It is necessary for the capacitor to be located as close as possible to the power and ground pins of the device in order to provide effective noise protection.

In addition, good PCB layout is key for better thermal conduction from the PCB temperature to the sensor die. For good temperature sensitivity, add a ground layer under the device pins, as shown in Figure 6-1.

6.2 Thermal Considerations

A potential for self-heating errors can exist if the MCP9804 SDA, SCL and Event lines are heavily loaded with pull-ups (high current). Typically, the self-heating error is negligible because of the relatively small current consumption of the MCP9804. A temperature accuracy error of approximately +0.5°C could result from self-heating if the communication pins sink/source the maximum current specified.

For example, if the event output is loaded to maximum IOL, Equation 6-1 can be used to determine the effect of self-heating.

**EQUATION 6-1: EFFECT OF SELF-HEATING**

\[
T_{\Delta} = \theta_{JA}(V_{DD}I_{DD} + V_{OL_Alert}I_{OL_Alert} + V_{OL_SDA}I_{OL_SDA})
\]

Where:

- \( T_{\Delta} \) = Junction Temperature
- \( T_A \) = Ambient Temperature
- \( \theta_{JA} \) = Package Thermal Resistance
- \( V_{OL_Alert, SDA} \) = Alert and SDA Output \( V_{OL} \)
  - \( (0.4 \ V_{max}) \)
- \( I_{OL_Alert, SDA} \) = Alert and SDA Output \( I_{OL} \)
  - \( (3 \ mA_{max}) \)

At room temperature (\( T_A = +25^\circ C \)) with maximum \( I_{DD} = 500 \ \mu A \) and \( V_{DD} = 3.6V \), the self-heating due to power dissipation \( T_{\Delta} \) is +0.2°C for the DFN-8 package and +0.5°C for the TSSOP-8 package.

7.0 PACKAGING INFORMATION

7.1 Package Marking Information

Legend:

XX...X  Customer-specific information
Y       Year code (last digit of calendar year)
YY      Year code (last 2 digits of calendar year)
WW      Week code (week of January 1 is week ‘01’)
NNN     Alphanumeric traceability code
e3      Pb-free JEDEC designator for Matte Tin (Sn)
*       This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

APPENDIX B: REVISION HISTORY

Revision C (January 2012)
The following is the list of modifications:
1. Typographical edits were made to the “Digital Input/Output Pin Characteristics” table.
2. The “Sensor Serial Interface Timing Specifications” table is updated with the 400 kHz timing specification.
3. Added typical specifications for accuracy drift and repeatability.

Revision B (December 2009)
The following is the list of modifications:
1. Updated the resolution parameter in the “Temperature Sensor DC Characteristics” table.
2. Updated Figure 5-7.
3. Updated Figure 5-10.
4. Updated Source Code in Appendix A.

Revision A (September 2009)
• Original Release of this Document.
PRODUCT IDENTIFICATION SYSTEM

Device: MCP9804: Digital Temperature Sensor
MCP9804T: Digital Temperature Sensor (Tape and Reel)

Temperature Range: E = -40°C to +125°C

Examples:

a) MCP9804-E/MC: Extended Temperature, 8LD DFN package
b) MCP9804-E/MS: Extended Temperature, 8LD MSOP package
c) MCP9804T-E/MC: Tape and Reel, Extended Temperature, 8LD DFN package
d) MCP9804T-E/MS: Tape and Reel, Extended Temperature, 8LD MSOP package.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
