Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to breach Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

NOTICE TO CUSTOMERS

All documentation becomes dated, and this manual is no exception. Microchip tools and documentation are constantly evolving to meet customer needs, so some actual dialogs and/or tool descriptions may differ from those in this document. Please refer to our web site (www.microchip.com) to obtain the latest documentation available.

Documents are identified with a “DS” number. This number is located on the bottom of each page, in front of the page number. The numbering convention for the DS number is “DSXXXXXA”, where “XXXXX” is the document number and “A” is the revision level of the document.

For the most up-to-date information on development tools, see the MPLAB® IDE on-line help. Select the Help menu, and then Topics to open a list of available on-line help files.

INTRODUCTION

This chapter contains general information that will be useful to know before using the PICDEM™ Z Demonstration Kit. Items discussed include:

• Document Layout
• Conventions Used in this Guide
• Warranty Registration
• Recommended Reading
• The Microchip Web Site
• Development Systems Customer Change Notification Service
• Customer Support

DOCUMENT LAYOUT

This document describes how to use the PICDEM Z Demonstration Kit as a development tool to evaluate and experiment with Microchip wireless solutions. The manual layout is as follows:

• Chapter 1: Overview – Describes the PICDEM Z Demonstration Kit and how it works.
• Chapter 2: Getting Started with the PICDEM™ Z Demonstration Kit – What you need to know to start using the PICDEM Z Demonstration Kit.
• Appendix A: PICDEM™ Z Motherboard Schematics – Hardware information on the PICDEM Z demonstration board.
• Appendix B: MRF24J40MA PICDEM Z 2.4 GHz RF Board – Hardware information on the MRF24J40MA PICDEM Z 2.4 GHz RF Board.
• Appendix C: PICDEM™ Z 2.4 GHz RF Card – Hardware information on the PICDEM Z 2.4 GHz RF Card.
CONVENTIONS USED IN THIS GUIDE

Where applicable, this manual uses the following documentation conventions:

WARRANTY REGISTRATION

Please complete the enclosed Warranty Registration Card and mail it promptly. Sending in the Warranty Registration Card entitles users to receive new product updates. Interim software releases are available at the Microchip web site.

RECOMMENDED READING

This user's guide describes how to use the PICDEM™ Z Demonstration Kit. Other useful documents are listed below. The following Microchip documents are available and recommended as supplemental reference resources.

AN1232 “Microchip ZigBee-2006 Residential Stack Protocol” (DS01232)
AN1066, “MiWi™ Wireless Networking Protocol Stack” (DS01066)
AN1204, “Microchip MiWi P2P Wireless Protocol” (DS01204)
AN1192, “MRF24J40 Radio Driver Utility Program” (DS01192)

These application notes describe how you can use the Microchip wireless solutions to quickly build your application. To illustrate the usage of the Microchip Wireless Protocol Stack’s working demo, applications are provided in their respective application notes. These demo applications can be used as a reference or simply modified and adapted to your requirements.

THE MICROCHIP WEB SITE

Microchip provides online support via our web site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

• **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user’s guides and hardware support documents, latest software releases and archived software
• **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
• **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives
DEVELOPMENT SYSTEMS CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip’s customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

The Development Systems product group categories are:

- **Compilers** – The latest information on Microchip C compilers and other language tools. These include the MPLAB C18 and MPLAB C30 C compilers; MPASM™ and MPLAB ASM30 assemblers; MPLINK™ and MPLAB LINK30 object linkers; and MPLIB™ and MPLAB LIB30 object librarians.
- **Emulators** – The latest information on Microchip in-circuit emulators. This includes the MPLAB ICE 2000 and MPLAB ICE 4000.
- **In-Circuit Debuggers** – The latest information on the Microchip in-circuit debugger, MPLAB ICD 2.
- **MPLAB® IDE** – The latest information on Microchip MPLAB IDE, the Windows® Integrated Development Environment for development systems tools. This list is focused on the MPLAB IDE, MPLAB SIM simulator, MPLAB IDE Project Manager and general editing and debugging features.
- **Programmers** – The latest information on Microchip programmers. These include the MPLAB PM3 and PRO MATE II device programmers and the PICSTART® Plus and PICkit™ 1 development programmers.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com

DOCUMENT REVISION HISTORY

Revision C (November 2008)

- Extensive rewrite of all sections.
Chapter 1. Overview

1.1 INTRODUCTION

This chapter introduces the PICDEM™ Z Demonstration Kit features. This chapter discusses:
- PICDEM™ Z Demonstration Kit Contents
- PICDEM Z Demonstration Kit
- PICDEM™ Z Motherboard
- Wireless Daughter Boards
- PICDEM™ Z CD-ROM

1.2 PICDEM™ Z DEMONSTRATION KIT CONTENTS

The PICDEM Z Demonstration Kit (Part Number DM163027-5) contains the following items:
1. Two PICDEM™ Z Motherboards
2. Two MRF24J40MA PICDEM Z 2.4 GHz RF Boards
3. PICDEM Z CD-ROM
4. ZENA™ Network Analyzer
5. USB Cable
6. ZENA CD-ROM

These items can be ordered separately. Table 1-1 lists the individual part numbers.

<table>
<thead>

</tbody>
</table>
1.3 PICDEM Z DEMONSTRATION KIT

The PICDEM Z Demonstration Kit allows developers to evaluate and develop with Microchip wireless solutions. The kit provides two motherboards and two 2.4 GHz MRF24J40MA daughter boards which can be used to form a simple two node wireless network. More nodes can be added by purchasing additional PICDEM Z Demonstration Kits or individual components (see Table 1-1).

The PICDEM Z Demonstration Kit comes preprogrammed with a wireless demo program. Refer to Chapter 2. “Getting Started with the PICDEM™ Z Demonstration Kit” to learn how to operate the preprogrammed demo program and how to load other Microchip Wireless Protocols for evaluation and development. Additional wireless protocols can be downloaded from the Microchip Wireless Design Center at http://www.microchip.com/wireless/.

The motherboard is powered by an external power supply via the 2.5 mm coaxial power connector (J1) or portably via a 9V battery (B1).

**Note:** The 9V wall adapter and 9V battery are not included in the kit. A 9V wall adapter may be ordered from microchipDIRECT under part number AC162039.

The kit comes with the ZENA™ Network Analyzer that graphically displays wireless network traffic following the IEEE 802.15.4™ specification on the 2.4 GHz band. The ZENA Network Analyzer supports IEEE 802.15.4, ZigBee™ and MiWi™ protocols. The software can analyze complete network traffic and graphically display decoded packets. It can also display a graphical representation of the network topology and the messages as they flow through the network. This information can then be saved and/or exported for further analysis. Refer to the User’s Guide (DS51606) for more information on the operation of the ZENA Network Analyzer.
1.4 PICDEM™ Z MOTHERBOARD

The PICDEM Z Motherboard contains many features to enable the evaluation and development of wireless solutions. Figure 1-2 shows the motherboard with a MRF24J40MA Module Daughter Board plugged in. Below is a description of the call outs in the figure. The motherboard schematic, PCB layout and bill of materials are available in Appendix A.

1. Microcontroller 28 and 40-pin DIP Sockets: The sockets allow the use of a variety of 28 and 40-pin DIP package PIC® microcontrollers. The 40-pin socket (U4) contains a PIC18LF4620 microcontroller clocked by a 4 MHz crystal (Y1). The 28-pin socket is unpopulated and is located under the 40-pin DIP package. To use the 28-pin connector, carefully remove the 40-pin DIP microcontroller.

2. Temperature Sensor: The motherboard contains the Microchip TC77 thermal sensor with SPI interface. The TC77 shares the SPI bus with the wireless daughter card plugged into connector J2.

3. LEDs: D1 and D2 are driven by microcontroller ports RA0 and RA1, respectively.

4. Push Button Switches: S2 and S3 are connected to microcontroller ports RB5 and RB4, respectively. There are no external pull-up resistors on the motherboard. Therefore, the internal pull-up on PORTB feature must be enabled.

5. MCLR Push Button Switch: Connected to the MCLR pin of the microcontroller.

6. ICSP™ Jack: The 6-pin RJ-11 jack is used to connect a microcontroller programmer such as the MPLAB ICD 2 in-circuit debugger or MPLAB REAL ICE™ in-circuit emulator.

7. RS-232 Connector: Allows the motherboard to connect to a PC serial port for interactive control or debugging. The microcontroller USART interfaces to the RS-232 connector via a RS-232 level shifter (U5).

8. Wireless Daughter Card Connector: Connector J2 is a 12-pin connector that supplies 3.3V power, 4-wire SPI, reset, wake and interrupt connections to the microcontroller. The pinout is shown in Figure 1-3. The 12-pin connector is a Samtec P/N LST-106-07-F-D.

9. Prototyping Area: Provided to breadboard additional circuitry for development. Connections to +3.3V, ground and microcontroller I/O signals are provided.

10. Power: The motherboard is powered by an external power supply via the 2.5 mm coaxial power connector (J1) or portably via a 9V battery (B1). The on-board voltage regulator (U2) is a LP2981, a micropower 100 mA ultra low-dropout regulator in a SOT-23 package. The maximum input voltage for the LP2981 is 16V. The motherboard is protected from accidental reverse power connection by diode D3. When using a 9V battery, S7 switches the power on and off. When powering via an external power supply, J1 will disconnect the battery from the circuit and power the circuit continuously (switch S7 only switches the battery on or off, not the external power source).

11. Measure Current: Jumper JP4 can be used to measure the current draw by all the circuitry on the motherboard past the voltage regulator (U2). To measure the current, cut the PCB trace on the bottom side and insert an ampmeter. You can also install a low value resistor into position R9 and measure the voltage across to determine the current.

CAUTION

Do not exceed the combined current rating of 100 mA for all circuitry or the voltage regulator will overheat and possibly fail.

Note: A 9V wall adapter may be ordered from microchipDIRECT under part number AC162039.

**FIGURE 1-2: PICDEM™ Z MOTHERBOARD**
1.5 WIRELESS DAUGHTER BOARDS

The PICDEM Z Motherboard is designed to interface with a variety of wireless daughter boards via connector J2. Connector J2 is a 12-pin connector that supplies 3.3V power, 4-wire SPI, reset, wake and interrupt connections to the microcontroller. The pinout is shown in Figure 1-3. The 12-pin connector is a Samtec P/N LST-106-07-F-D.

1.6 PICDEM™ Z CD-ROM

The PICDEM Z CD-ROM contains documentation on the motherboard, wireless daughter boards, data sheets, application notes and wireless protocol software. Check the Microchip web site for the latest revisions http://www.microchip.com/wireless/.
Chapter 2. Getting Started with the PICDEM™ Z Demonstration Kit

2.1 INTRODUCTION

The PICDEM Z Demonstration Kit can be used with a variety of Microchip software protocol stacks or it can be used to develop proprietary protocol stacks. Microchip software protocol stacks are available as a free download, including source code, from the Microchip website: http://www.microchip.com/wireless/.

The PICDEM Z Demonstration Kit assumes that the user is familiar with Microchip PIC microcontrollers and development tools such as MPLAB IDE. There is a wealth of getting started information on the Microchip website http://www.microchip.com/. Select the Design>Getting Started links for more information about microcontrollers and development tools.

Topics covered in this chapter include:
- Microchip ZigBee-2006 Residential Stack Protocol
- Microchip MiWi™ Protocol
- Microchip MiWi P2P Protocol

2.2 MICROCHIP ZIGBEE-2006 RESIDENTIAL STACK PROTOCOL

The ZigBee protocol is a wireless network protocol specifically designed for low data rate, low-cost wireless sensors and control networks. It is based on the IEEE 802.15.4 global standard ensuring interoperability and reliable communication. ZigBee protocol supports star, cluster and mesh wireless network topologies making it well suited for short range and low-power applications. The Microchip ZigBee-2006 protocol is certified to run on the PIC18 and PIC24 families of Microchip PIC microcontrollers and the MRF24J40 2.4 GHz RF Transceiver.

The software stack is available on the PICDEM Z CD-ROM. Check the Microchip website for the latest revision at http://www.microchip.com/wireless/. Once the software stack is installed, the source code and documentation are available at: C:\Microchip Solutions\ZigBee2006Res\.

The PICDEM Z Demonstration Kit is preprogrammed with a ZigBee protocol demo program. Please refer to the “Getting Started: Running the ZigBee-2006 Demo” document located in the directory: C:\Microchip Solutions\ZigBee2006Res\.

Complete documentation is available in application note AN1232, “Microchip ZigBee-2006 Residential Stack Protocol” (DS01232).
2.3 MICROCHIP MiWi™ PROTOCOL

The MiWi Wireless Networking Protocol is a simple protocol designed for low data rate, short distance, low-cost networks. It is an application layer on top of the IEEE 802.15.4 MAC and PHY layers. The MiWi protocol provides an easy-to-use alternative for wireless communication. In particular, it targets smaller applications that have relatively small network sizes with few hops between nodes. The MiWi protocol runs on a variety of Microchip PIC microcontrollers in the PIC18, PIC24 and PIC32 families and the MRF24J40 2.4 GHz RF Transceiver.

The software stack is available on the PICDEM Z CD-ROM. Check the Microchip website for the latest revision http://www.microchip.com/wireless/. Once the software stack is installed, the source code and documentation are available at:

C:\Microchip Solutions\MiWi\n
To load and run the MiWi Protocol demonstration program, please refer to the “Getting Started: Running the MiWi™ demo” document located in the above directory.

Complete documentation is available in application note AN1066, “MiWi™ Wireless Networking Protocol Stack” (DS01066).

2.4 MICROCHIP MiWi P2P PROTOCOL

The MiWi Peer-to-Peer (P2P) protocol is an application layer on top of the IEEE 802.15.4 MAC and PHY layers that supports peer-to-peer and star topologies. It has no routing mechanism, so the wireless communication coverage is defined by the radio range. Application note AN1204, “Microchip MiWi P2P Wireless Protocol” describes the MiWi P2P protocol. It details the supported features and how to implement them. Simple application level data structures and programming interfaces are also described. The MiWi P2P protocol runs on a variety of Microchip PIC microcontrollers in the PIC18, PIC24 and PIC32 families and the MRF24J40 2.4 GHz RF Transceiver.

The software stack is available on the PICDEM Z CD-ROM. Check the Microchip website for the latest revision at http://www.microchip.com/wireless/. Once the software stack is installed, the source code and documentation are available at:

C:\Microchip Solutions\P2P\n
To load and run the MiWi P2P Protocol demonstration program, please refer to the “Getting Started: Running the MiWi™ P2P demo” document located in the above directory.

Complete documentation is available in application note AN1204, “Microchip MiWi P2P Wireless Protocol” (DS01204).
Appendix A. PICDEM™ Z Motherboard Schematics

A.1 PICDEM Z MOTHERBOARD SCHEMATICS

The PICDEM Z motherboard schematics are shown here. The RF daughter card schematics are found in the appendices that follow.

Topic included in this appendix are:

• PICDEM Z Motherboard Schematics
• PICDEM Z Motherboard Bill of Materials
FIGURE A-2: PICDEM™ Z MOTHERBOARD TOP ASSEMBLY
### A.2 PICDEM Z MOTHERBOARD BILL OF MATERIALS

Appendix B. MRF24J40MA PICDEM Z 2.4 GHz RF Board

B.1 INTRODUCTION

This appendix describes the MRF24J40MA Z 2.4 GHz RF Board. Topics covered in this appendix include:

- MRF24J40MA PICDEM Z 2.4 GHz RF Board
- Schematic
- PCB Layout
- Bill of Materials

B.2 MRF24J40MA PICDEM Z 2.4 GHz RF BOARD

The MRF24J40MA PICDEM Z 2.4GHz RF Board (AC163028) is shown in Figure B-1. It features the MRF24J40MA transceiver module. The MRF24J40MA is a fully FCC, IC and ETSI certified module. It is designed to plug into the PICDEM Z Motherboard, or to any application, using a 12-pin connector. The 12-pin connector is available from Samtec P/N LST-106-07-F-D.

For more information about the MRF24J40 IC and module, refer to:

- “MRF24J40 2.4 GHz IEEE 802.15.4 RF Transceiver Data Sheet” (DS39776)
- “MRF24J40MA 2.4 GHz IEEE 802.15.4 RF Transceiver Module Data Sheet” (DS70329)

Features of the PICDEM Z MRF24J40 2.4 GHz RF Board include:

1. MRF24J40MA Transceiver Module (U1): An IEEE 802.15.4 compliant transceiver module.
2. Daughter Card Connector (P1): Connector P1 is a 12-pin connector used to connect to the PICDEM Z Motherboard or any application with a mating connector. It supplies 3.3V power, 4-wire SPI, reset, wake and interrupt connections to the MRF24J40MA. The pinout is shown in Figure B-2. The 12-pin connector is a Samtec P/N LST-106-07-F-D.
B.3 SCHEMATIC

The schematic for the MRF24J40MA module is available in the MRF24J40MA Data Sheet (DS70329). Figure B-2 shows the schematic of the daughter board with the MRF24J40MA module mounted on it.

FIGURE B-2: MRF24J40MA PICDEM™ Z 2.4 GHz RF BOARD SCHEMATIC

B.4 PCB LAYOUT

Figure B-3 through Figure B-6 show the PCB layout of the daughter board without the MRF24J40MA module mounted on it.

Appendix C. PICDEM™ Z 2.4 GHz RF Card

C.1 INTRODUCTION

This appendix describes the PICDEM Z MRF24J40 2.4 GHz Daughter Card. Topics discussed in this chapter are:

- The PICDEM™ Z MRF24J40 2.4 GHz Daughter Card
- Schematic
- PCB Layout
- PICDEM Z MRF24J40 Daughter Card Bill of Materials
- PCB Antenna Details

C.2 THE PICDEM™ Z MRF24J40 2.4 GHz DAUGHTER CARD

The PICDEM Z MRF24J40 2.4 GHz Daughter Card (AC163027-4) is shown in Figure C-1. It features the MRF24J40 transceiver IC, all passive circuitry, PCB antenna, and optional SMA connector footprint. It is designed to plug into the PICDEM Z Motherboard, or to any application, using a 12-pin connector or Explorer 16 Development Board using the side edge connector.

The PICDEM Z MRF24J40 2.4 GHz Daughter Card is a good platform to evaluate an inverted F-type PCB antenna. The optional SMA connector can be populated to evaluate external antenna options or to connect to test equipment for measurement.

The PICDEM Z MRF24J40 2.4 GHz Daughter Card may be used as a reference design. The Gerber files are available for download on the at Microchip website http://www.microchip.com/wireless/ and on the PICDEM Z CD-ROM.

More information about the MRF24J40 IC, refer to:

"MRF24J40 2.4 GHz IEEE 802.15.4 RF Transceiver Data Sheet" (DS39776)

Features of the PICDEM Z MRF24J40 2.4 GHz Daughter Card include:

1. MRF24J40 Transceiver IC (U1): An IEEE 802.15.4 compliant transceiver IC in a 40-pin QFN package.
2. Daughter Card Connector (J2): Connector J2 is a 12-pin connector used to connect to the PICDEM Z Motherboard or any application with a mating connector. It supplies 3.3V power, 4-wire SPI, reset, wake and interrupt connections to the MRF24J40. The pinout is shown in Figure C-2. The 12-pin connector is a Samtec P/N LST-106-07-F-D.
3. PCB Edge Connector (J3): Connector J3 is a 30-pin connector used to connect to the Explorer 16 Development Board. It supplies 3.3V power, 4-wire SPI, reset, wake and interrupt connections to the MRF24J40. The pinout is shown in Figure C-2.
4. PCB Antenna: An inverted F-type PCB antenna.
5. Optional SMA Connector (P5): The SMA footprint may be populated with an SMA connector for connecting to an external antenna or test equipment. The PCB antenna is connected by default. To enable the SMA connector and disable the PCB antenna, removed capacitor C38 and move it to position C8.

The MRF24J40 SDO pin 17 defaults to a low state when nCS is high (the MRF24J40 is not selected). If the MRF24J40 Daughter Card is to share an SPI bus, a tri-state buffer can be placed on the SDO signal to provide a high-impedance signal to the SPI bus. Refer to the “MRF24J40 Data Sheet” (DS39776) for more information.

C.3 SCHEMATIC

The PICDEM Z MRF24J40 2.4 GHz Daughter Card schematic is shown in Figure C-2.
The PICDEM Z MRF24J40 2.4 GHz Daughter Card is fabricated as a four layer PCB. The material is FR4 with signal traces in 0.5 oz copper. Figure C-4 through Figure C-9 show the individual layers from top to bottom. Figure C-10 shows the layer stack up.

The following guidelines are intended to aid users in high-frequency PCB layout design. The printed circuit board is comprised of four basic FR4 layers: signal layout, RF ground, power line routing and ground (see Figure C-3). The guidelines will explain the requirements of these layers.

**FIGURE C-3: FOUR BASIC COPPER FR4 LAYERS**

- It is important to keep the original PCB thickness since any change will affect antenna performance (see total thickness of dielectric) or microstrip lines characteristic impedance.
- The first layer width of a 50Ω characteristic impedance microstrip line is 12 mils.
- Avoid having microstrip lines longer than 2.5 cm, since that line might get very close to a quarter wave length of the working frequency of the board which is 3.0 cm, and start behaving as an antenna.
- Except for the antenna layout, avoid sharp corners since they can act as an antenna. Round corners will eliminate possible future EMI problems.
- Digital lines by definition are prone to be very noisy when handling periodic waveforms and fast clock/switching rates. Avoid laying out a RF signal close to any digital lines.
- A via filled ground patch underneath the IC transceiver is mandatory.
- A power supply must be distributed to each pin in a star topology and low-ESR capacitors must be placed at each pin for proper decoupling noise.
- Thorough decoupling on each power pin is beneficial for reducing in-band transceiver noise, particularly when this noise degrades performance. Usually, low value caps (27-47 pF) combined with large value caps (100 nF) will cover a large spectrum of frequency.
- Passive components (inductors) must be in the high-frequency category and the SRF (Self-Resonant Frequency) should be at least two times higher than the operating frequency.

**Note:** Care should be taken with all ground lines to prevent breakage.

C.6 PCB ANTENNA DETAILS

FIGURE C-11: IMPEDANCE OF THE PCB ANTENNA

FIGURE C-12: IMPEDANCE OF THE PCB ANTENNA IN SMITH CHART
The most critical part of maintaining proper impedance is adhering to the specified dimensions of the printed circuit board antenna (see Figure C-14). The antenna dimensions, if altered, will change the specified impedance. As an example, a 1 mm variance will shift the impedance by 5-10 MHz.

**Note:** This part has been simulated using a HFSS™ simulator by Ansoft Corporation.

**FIGURE C-14:** PRINTED CIRCUIT BOARD ANTENNA DIMENSIONS

Note 1: Dimensions are in mm and tolerance is +/- 0.05 mm.
