Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

NOTICE TO CUSTOMERS

All documentation becomes dated, and this manual is no exception. Microchip tools and documentation are constantly evolving to meet customer needs, so some actual dialogs and/or tool descriptions may differ from those in this document. Please refer to our web site (www.microchip.com) to obtain the latest documentation available.

Documents are identified with a “DS” number. This number is located on the bottom of each page, in front of the page number. The numbering convention for the DS number is “DSXXXXXXA”, where “XXXXX” is the document number and “A” is the revision level of the document.

For the most up-to-date information on development tools, see the MPLAB® IDE on-line help. Select the Help menu, and then Topics to open a list of available online help files.

INTRODUCTION

This chapter contains general information that will be useful to know before using the RTD Reference Design. Items discussed in this chapter include:

• Document Layout
• Conventions Used in this Guide
• Recommended Reading
• The Microchip Web Site
• Customer Support
• Document Revision History

DOCUMENT LAYOUT

This document describes how to use the RTD Reference Design as a development tool to emulate and debug firmware on a target board. The manual layout is as follows:

• Chapter 1. “Product Overview” – Important information about the RTD Reference Design.
• Chapter 2. “Installation and Operation” – This chapter includes a detailed description of each function of the demo board and instructions for how to begin using the board.
• Appendix A. “Schematic and Layouts” – Shows the schematic and layout diagrams for the RTD Reference Design.
• Appendix B. “Bill of Materials” – Lists the parts used to build the RTD Reference Design.
CONVENTIONS USED IN THIS GUIDE

This manual uses the following documentation conventions:

RECOMMENDED READING

This user's guide describes how to use the RTD Reference Design. Other useful documents are listed below. The following Microchip documents are available and recommended as supplemental reference resources.

**MCP3551 Data Sheet, “Low-Power, Single-Channel 22-Bit Delta-Sigma ADCs” (DS21950)**

This data sheet provides detailed information regarding the MCP3551 device.

**AN1154 - “Precision RTD Instrumentation for Temperature Sensing” (DS01154)**

This application note provides information on the RTD Instrumentation technique for high performance thermal management applications.

THE MICROCHIP WEB SITE

Microchip provides online support via our web site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user’s guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: [http://support.microchip.com](http://support.microchip.com).

DOCUMENT REVISION HISTORY

**Revision A (September 2010)**

- Initial Release of this Document.
Chapter 1. Product Overview

1.1 INTRODUCTION

The following name and assembly number are found on the RTD Reference Design’s Printed Circuit Board (PCB):

• 102-00115

1.2 WHAT IS THE RTD REFERENCE DESIGN?

The RTD Reference Design demonstrates how to implement a Resistive Temperature Detector (RTD) and accurately measure temperature. This solution uses the MCP3551 22-Bit Analog-to-Digital Converter (ADC) to measure voltage across the RTD. The ADC and the RTD are referenced using an on-board reference voltage, and the ADC inputs are directly connected to the RTD terminals. This provides a ratio metric temperature measurement. The solution uses a current limiting resistor to bias the RTD. It provides a reliable and accurate RTD instrumentation without the need for extensive circuit compensation and calibration routines.

In addition, this reference design includes a silicon temperature sensor, MCP9804. This sensor is used for comparison only, it is not needed for the RTD instrumentation circuit. The MCP3551 and MCP9804 outputs are read using a USB PIC® MCU. This controller is also connected to a PC using USB interface. The Thermal Management software is used to plot the RTD temperature data in strip chart format.

1.3 WHAT THE RTD REFERENCE DESIGN KIT INCLUDES

This RTD Reference Design Kit includes:

• RTD Reference Design, 102-00115
• USB cable
• Important Information Sheet
Chapter 2. Installation and Operation

2.1 INTRODUCTION

The RTD Reference Design demonstrates Microchip’s solution to accurately measure temperature using a 22-bit ADC, MCP3551. This solution eliminates the need for the traditional analog instrumentation system calibration or gain and offset trimming techniques. In addition, the effect of self-heat can be minimized by limiting the RTD biasing current using a single resistor.

This reference design uses the technique described in Application Note AN1154 - “Precision RTD Instrumentation for Temperature Sensing” (DS01154). The RTD Reference Design allows users to evaluate Microchip’s solution to accurately measure temperature using an RTD. RTD resistance availability typically ranges from 100Ω to 5000Ω. When biasing an RTD to measure temperature, self-heat due to power dissipation has to be considered. In order to output measurable voltage across the RTD for wide temperature range, the biasing current has to be relatively high. This causes higher power dissipation through heat and skews the temperature reading. This solution uses a ratiometric technique between the RTD resistance and the ADC resolution to achieve high accuracy throughout the entire sensor range.

This solution uses an on-board (local) surface mount RTD and an external RTD. The local and external RTDs are selected using JP2. The MCP9804 temperature sensor is also used to measure local temperature.

The MCP3551 and the MCP9804 serial output lines are connected to a PIC MCU. RTD linearization is computed with the microcontroller. This controller communicates with a PC via the USB interface. The temperature data is then displayed on the PC using the Thermal Management software in strip chart format.

2.2 FEATURES

The RTD Reference Design has the following features:

• Surface mount PT100 RTD
• External RTD connector (not included)
• Thermal Management GUI
• 22-Bit ADC MCP3551
• ±1°C Maximum accuracy temperature sensor MCP9804
• PIC18F2550 microcontroller
• USB interface to PC
2.3 GETTING STARTED

This section describes how to quickly configure the RTD Reference Design. A simplified block diagram of the configuration is provided in Figure 2-1.

![RTD Reference Design Simplified Block Diagram](image)

**FIGURE 2-1:** RTD Reference Design Simplified Block Diagram.

2.3.1 Hardware Setup

1. Connect the USB cable to PC
2. Select JP2 for Local/External RTD
3. Start the Thermal Management software

2.3.2 Software Setup

Once the USB interface is secured, start the Thermal Management Software. When the software starts, if the hardware is successfully detected, the GUI will be displayed (Figure 2-2).

![RTD Reference Design GUI](image)

**FIGURE 2-2:** RTD Reference Design GUI.
This configuration window allows the user to set some parameters, such as measurement unit and calibration temperature.

The Play, Stop, and Reset icons (Figure 2-3) can be used to perform a continuous data-log. The Record icon enables the user to data-log to an external file. The logging interval can be adjusted using the Interval Scroll bar from 100 ms to 30s.

**FIGURE 2-3: Real-Time Acquisition.**

The RTD temperature is linearized using ASTM specification #E 1137. The linearization is implemented in the PIC MCU.

The Data Acquisition charting tool can be customized by double-clicking the chart, as shown in Figure 2-4. Additional options are available by right-clicking the chart. The user can also zoom into a specific plot range by clicking and dragging the section. The data in the chart can also be exported using the Export button.

**FIGURE 2-4: Chart Setup Options.**
2.3.3  Sensor Calibration

2.3.3.1  RTD SETUP

The RTD sensor can be calibrated using the GUI. Once the RTD is exposed to the
dies calibration temperature, simply type in the temperature in the Calibration
Temperature field and click the Calibrate button. When the temperature is
calibrated and the calibration offset is stored in the PIC MCU EEPROM, the
calibration offset is displayed in the RTD Calibration Offset text box. The Reset
button resets the calibration offset to “0”.

**FIGURE 2-5:**  Sensor Calibration.

The GUI also enables users to set the RTD biasing resistor value, $R_9$. If a resistor other
than a 100\(\Omega\) RTD resistor is connected, then replace $R_9$ (for operation and details refer
to the AN1154). The Reset button sets $R_9$ to the default value of 6800\(\Omega\).

**FIGURE 2-6:**  Setting RTD Biasing Resistor.
2.3.3.2 MCP9804 SETUP

The MCP9804 is a silicon temperature sensor which measures temperature with ±0.25°C nominal and ±1°C maximum accuracy from -40°C to +125°C. This sensor has multiple user programmable features such as Alert Output limits, output hysteresis and mode (see Figure 2-7). The output mode can be set up as either comparator or interrupt output with an active-high or active-low levels. The temperature measurement resolution can also be set up.
