Op Amp/Comparator

HIGHLIGHTS

This section of the manual contains the following major topics:

1.0 Introduction ................................................................................................................ ....... 2
2.0 Comparator Registers....................................................................................................... 5
3.0 Comparator Operation .................................................................................................... 17
4.0 Comparator Configuration............................................................................................... 18
5.0 Comparator Interrupts..................................................................................................... 22
6.0 Op Amp Configuration .................................................................................................... 24
7.0 Comparator Voltage Reference Generator ..................................................................... 26
8.0 Related Application Notes............................................................................................... 32
9.0 Revision History ............................................................................................................ .. 33
1.0  INTRODUCTION

The dsPIC33E/PIC24E devices have multiple built-in comparators, some of which can also be configured as op amps, with their output being brought to an external pin for gain/filtering connections.

As illustrated in Figure 1-1 and Figure 1-3, individual comparator and op amp options are specified by the module's Special Function Register (SFR) control bits. These options allow users to:

- Select the edge for trigger and interrupt generation
- Configure the comparator voltage reference
- Configure the band gap
- Configure output blanking and masking
- Configure as a comparator or op amp

The op amp/comparator and comparator operating modes are configured through the CMxCON register. Some of the options include Op Amp or Comparator mode, polarity selection of the comparator and inverting/non-inverting comparator polarity, as well as input selection options.

An option is also available to use the internal reference voltage that is generated by a resistor ladder network, which is configured by the Comparator Voltage Reference Control (CVRCON) register (see Register 2-7 and Register 2-8).
**Op Amp/Comparator**

Figure 1-1: Dedicated Comparator Module Block Diagram

Figure 1-2: Dedicated Comparator Module Block Diagram for Devices with Band Gap Reference Circuit

![Comparator Module Block Diagram with Band Gap Reference](image)

**Note:** Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for the available comparators.
Figure 1-3: Op Amp/Comparator Module Block Diagram

Note: Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for the available comparators.
2.0 COMPARATOR REGISTERS

The op amp/comparator module uses the following eight registers:

- **CMSTAT: Comparator Status Register**
  This register enables control over the operation of all comparators when the device enters Idle mode. In addition, it provides the status of all comparator results, as well as all of the comparator outputs and event bits, which are replicated as read-only bits in the CMSTAT register.

- **CMxCON: Op Amp/Comparator x Control Register**
  This register allows the application program to enable, configure and interact with the individual comparators/op amps (on some devices).

- **CMxMSKSRC: Comparator x Mask Source Select Control Register**
  This register allows the application program to select sources for the inputs to the blanking function.

- **CMxMSKCON: Comparator x Mask Gating Control Register**
  This register allows the application program to specify the blank function logic.

- **CMxFLTR: Comparator x Filter Control Register**
  This register enables comparator filter configuration.

- **CVRCON: Comparator Voltage Reference Control Register(4)**
  This register allows the application program to enable, configure and interact with the comparator internal voltage reference generator (for more information, see Section 7.0 “Comparator Voltage Reference Generator”).

- **CVR1CON: Comparator Voltage Reference Control Register 1(4)**
  This register allows the application program to enable, configure and interact with the comparator internal voltage reference generator (for more information, see Section 7.0 “Comparator Voltage Reference Generator”).

- **CVR2CON: Comparator Voltage Reference Control Register 2(4)**
  This register allows the application program to enable, configure and interact with the comparator internal voltage reference generator (for more information, see Section 7.0 “Comparator Voltage Reference Generator”).

**Note 1:** The CVR1CON and CVR2CON registers are present on devices with two DACs. If a device has only one DAC, then only the CVRCON register is present.
Register 2-1: CMSTAT: Comparator Status Register

Note 1: This bit not available on all devices. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for availability.

Note 2: Inputs that are selected and not available will be tied to Vss.

Note 3: This input is not available when OPMODE (CMxCON<10>) = 1.
Register 2-2: CMxCON: Op Amp/Comparator x Control Register (Continued)

bit 7-6  EVPOL<1:0>: Trigger/Event/Interrupt Polarity Select bits
        11 = Trigger/event/interrupt is generated on any change of the comparator output (while CEVT = 0)
        10 = Trigger/event/interrupt is generated only on high-to-low transition of the polarity selected
             comparator output (while CEVT = 0)
             If CPOL = 1 (inverted polarity):
             Low-to-high transition of the comparator output.
             If CPOL = 0 (non-inverted polarity):
             High-to-low transition of the comparator output.
        01 = Trigger/event/interrupt is generated only on low-to-high transition of the polarity selected comparator
             output (while CEVT = 0)
             If CPOL = 1 (inverted polarity):
             High-to-low transition of the comparator output.
             If CPOL = 0 (non-inverted polarity):
             Low-to-high transition of the comparator output.
        00 = Trigger/event/interrupt generation is disabled

bit 5  Unimplemented: Read as '0'

bit 4  CREF: Comparator Reference Select bit (VIN+ input)(2)
        1 = VIN+ input connects to internal CVREFIN voltage(3)
        0 = VIN+ input connects to CxIN1+ pin

bit 3-2  Unimplemented: Read as ‘0’

bit 1-0  CCH<1:0>: Op Amp/Comparator Channel Select bits(2)
        These bits select the CxIN1, CxIN2 and CxIN3 inputs. Refer to the “Comparator” or “Op Amp/Comparator” chapter in
        the specific device data sheet for the available selections.

Note 1: This bit not available on all devices. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the
        specific device data sheet for availability.
        2: Inputs that are selected and not available will be tied to VSS.
        3: This input is not available when OPMODE (CMxCON<10>) = 1.

- **U** = Unimplemented bit, read as '0'
- **-n** = Value at POR
- ‘1’ = Bit is set
- ‘0’ = Bit is cleared
- **x** = Bit is unknown

- **bit 15-12** Unimplemented: Read as ‘0’
- **bit 11,5** CVRR<1:0>: Comparator Voltage Reference Range Selection bits
  - 11 = 0.00 CVRSRC to 0.94, with CVRSRC/16 step-size
  - 10 = 0.33 CVRSRC to 0.96, with CVRSRC/24 step-size
  - 01 = 0.00 CVRSRC to 0.67, with CVRSRC/24 step-size
  - 00 = 0.25 CVRSRC to 0.75, with CVRSRC/32 step-size

- **bit 10** VREFSEL: Voltage Reference Select bit
  - 1 = Reference source for inverting input is from CVR2
  - 0 = Reference source for inverting input is from CVR1

- **bit 9-8** Unimplemented: Read as ‘0’

- **bit 7** CVREN: Comparator Voltage Reference Enable bit
  - 1 = Comparator voltage reference circuit is powered on
  - 0 = Comparator voltage reference circuit is powered down

- **bit 6** CVR2OE: Comparator Voltage Reference Output Enable bit
  - 1 = Voltage level (CVREFIN) is output on the CVREF20 pin
  - 0 = Voltage level (CVREFIN) is disconnected from the CVREF20 pin

- **bit 4** CVRSS: Comparator Voltage Reference Source Selection bit
  - 1 = Comparator voltage reference source, CVRSRC = (VREF+) – (AVSS)
  - 0 = Comparator voltage reference source, CVRSRC = AVDD – AVSS

- **bit 3-0** CVR<3:0>: Comparator Voltage Reference Value Selection 0 ≤ CVR<3:0> ≤ 15 bits
  - When CVRR<1:0> = 11:
    - CVREF = (CVR<3:0>/16) • (CVRSRC)
  - When CVRR<1:0> = 10:
    - CVREF = 1/3 • (CVRSRC) + (CVR<3:0>/24) • (CVRSRC)
  - When CVRR = 01:
    - CVREF = (CVR<3:0>/24) • (CVRSRC)
  - When CVRR = 00:
    - CVREF = 1/4 • (CVRSRC) + (CVR<3:0>/32) • (CVRSRC)

**Note 1:** These bits are not available on all devices. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for availability.

**Note 2:** This bit overrides the TRISx bit setting.

**Note 3:** Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for available bit selections.

**Note 4:** This register is available in devices with two DACs.
3.0 COMPARATOR OPERATION

The operation of a typical comparator and the relationship between the analog input levels and the digital output are illustrated in Figure 3-1. Depending on the comparator operating mode, the monitored analog signal is compared to either an external or internal voltage reference. Each of the comparators can be configured to use the same or different reference sources. For example, one comparator can use an external reference while the others can use the internal reference. For more information on comparator operation, see Section 7.0 “Comparator Voltage Reference Generator”.

In Figure 3-1, the external reference, VIN-, is a fixed external voltage. The analog signal present at VIN+ is compared to the reference signal at VIN- and the digital output of the comparator is created by the difference between the two signals. When VIN+ is less than VIN-, the output of the comparator is a digital low level. When VIN+ is greater than VIN-, the output of the comparator is a digital high level. The shaded areas of the output represent the area of uncertainty due to input offsets and response time. The polarity of the comparator output can be inverted, so that it is a digital low level when VIN+ is greater than VIN-.

Figure 3-1: Comparator Operation

Input offset represents the range of voltage levels within which the comparator trip point can occur. The output can switch at any point in this offset range. Response time is the minimum time required for the comparator to recognize a change in input levels.
4.0 COMPARATOR CONFIGURATION

Each of the comparators in the comparator or op amp/comparator modules is configured independently by various control bits in the following registers:

- CMSTAT: Comparator Status Register (Register 2-1)
- CMxCON: Op Amp/Comparator x Control Register (Register 2-2)
- CMxMSKSRRC: Comparator x Mask Source Select Control Register (Register 2-3)
- CMxMSKCON: Comparator x Mask Gating Control Register (Register 2-4)
- CMxFLTR: Comparator x Filter Control Register (Register 2-5)
- CVR1CON: Comparator Voltage Reference Control Register 1 (Register 2-7)
- CVR2CON: Comparator Voltage Reference Control Register 2 (Register 2-8)

4.1 Comparator Enable/Disable

The comparator under control may be enabled or disabled using the corresponding CON bit (CMxCON<15>). When the comparator is disabled, the corresponding trigger and interrupt generation is disabled when CON = 0.

It is recommended to first configure the CMxCON register with all bits to the desired value and then set the CON bit (CMxCON<15>).

4.2 Comparator Output Blanking Function

In many power control and motor control applications, there are periods of time in which the inputs to the analog comparator are known to be invalid. The blanking (masking) function enables the user to ignore the comparator output during predefined periods of time. In this document, the terms, ‘masking’ and ‘blanking’, are used interchangeably.

Figure 4-1 illustrates a block diagram of the comparator blanking circuitry. A blanking circuit is associated with each comparator.

Each comparator’s blanking function has three user-selectable inputs:

- MAI (Mask A Input)
- MBI (Mask B Input)
- MCI (Mask C Input)

The MAI, MBI and MCI signal sources are selected through the SELSRCA<3:0>, SELSRCB<3:0> and SELSRCC<3:0> bits in the CMxMSKSRRC register.

The MAI, MBI and the MCI signals are fed into an AND-OR function block, which enables the user to construct a blanking (masking) signal from these inputs. The blanking (masking) function is disabled following a system Reset.

The HLMS bit in the CMxMSKCON register configures the masking logic to operate properly, depending on the default (deasserted) state of the comparators.

If the comparator is configured for ‘positive logic’, so that a ‘0’ represents a deasserted state and the comparator output is a ‘1’ when it is asserted, the HLMS bit (CMxMSKCON<15>) should be set to ‘0’ so that the blanking function (assuming the blanking function is active) will prevent the ‘1’ signal of the comparator from propagating through the module.

If the comparator is configured for ‘negative logic’, so that a ‘1’ represents a deasserted state and the comparator output is a ‘0’ when it is asserted, the HLMS bit should be set to a ‘1’ so that the blanking function (assuming blanking function is active) will prevent the ‘0’ signal of the comparator from propagating through the module.
4.3 Digital Output Filter

In many motor and power control applications, the comparator input signals can be corrupted by the large electromagnetic fields generated by the associated external switching power transistors. Corruption of the analog input signals to the comparator can cause unwanted comparator output transitions. The programmable digital output filter can minimize the effects of input signal corruption.

The digital filter requires three consecutive input samples to be similar before the output of the filter can change state. Assuming the current state is '0', a string of inputs, such as '001010110111', will only yield an output state of '1', at the end of the example sequence, after the three consecutive '1's. Similarly, a sequence of three consecutive '0's is required before the output will change to a zero state.

Because of the requirement of three similar consecutive states for the filter, the chosen digital filter clock period must be one-third or less than the maximum desired comparator response time.

The digital filter is enabled by setting the CFLTREN bit (CMxMSK<3>). The CFDIV<2:0> bits (CMxFLTR<2:0>) select the clock divider ratio for the clock signal input to the digital filter block. The CFSEL<2:0> bits (CMxFLTR<6:4>) select the desired clock source for the digital filter. The digital filter is disabled (bypassed) following a system Reset.
4.4 Comparator Polarity Selection

To provide maximum flexibility, the output of the comparator may be inverted using the CPOL bit (CMxCON<13>). This is functionally identical to reversing the inverting and non-inverting inputs of the comparator for a particular mode.

The CPOL bit should be changed only when the comparator is disabled (CON = 0). Internal logic will prevent the generation of any corresponding triggers or interrupts when CON = 0. This logic allows both the CON and CPOL bits to be set with a single register write.

4.5 Event Polarity Selection

In addition to a programmable comparator output polarity, the op amp/comparator module also allows software selection for trigger/interrupt edge polarity through the EVPOL<1:0> bits in the corresponding CMxCON register. This feature allows independent control of the comparator output, as seen on any external pins, and the trigger/interrupt generation.

Note: The corresponding comparator must be enabled (CON = 1) for the specific trigger/interrupt generation to be enabled.

4.6 Comparator Reference Input Selection

The input to the non-inverting input of the comparator, also known as the reference input, can be selected by the value of the CREF bit (CMxCON<4>). For more information on the CREF bit, see Register 2-2.

4.7 Comparator Channel Selection

The input to the inverting input of the comparator, also known as the channel input, can be selected by the CCH<1:0> bits (CMxCON<1:0>). For more information on the CCHx bits, see Register 2-2.

Note: Not all inputs are available for both the op amp or comparator modules. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for the available inputs.
4.8 Comparator Event Status Bit

The Comparator Event Status (CEVT) bit (CMxCON<9>) reflects whether or not the comparator has gone through the preconfigured event. After the bit is set, all future triggers and interrupts from the corresponding comparator will be blocked until the user-assigned application clears the CEVT bit. Clearing the CEVT bit begins rearming the trigger. Once the CEVT bit is cleared, it takes an extra CPU cycle for the comparator triggers to be fully rearmed.

4.9 Status Register

To provide an overview of all comparator results, the Comparator Output bit, COUT (CMxCON<8>), and Comparator Event bit, CEVT (CMxCON<9>), are replicated as status bits in the CMSTAT register.

These bits are read-only and can be altered only by manipulating the corresponding CMxCON register or the comparator input signals.
5.0 COMPARATOR INTERRUPTS

The Comparator Interrupt Flag (CMPIF) bit (IFS1<2>) is set when the synchronized output value of any of the comparators changes, with respect to the last read value. The CxEVT bits in the CMSTAT register can be read by the user application to detect an event.

User-assigned software can read the CEVT and COUT bits (CMxCON<9> and CMxCON<8>) to determine the change that occurred. Because it is possible to write a ‘1’ to this register, a simulated interrupt can be software initiated. Both the CMPIF and CEVT bits must be reset by clearing them in software. These bits can be cleared in the Interrupt Service Routine (ISR). For more information, refer to the “dsPIC33E/PIC24E Family Reference Manual”, “Interrupts” (DS70600).

Note 1: The comparison required for generating interrupts is based on the current comparator state and the last read value of the comparator outputs. Reading the COUT bit in the CMxCON register will update the values used for the interrupt generation.

2: When configured as an op amp (OPMODE = 1), the comparator interrupts are disabled.

5.1 Interrupt Operation During Sleep Mode

If a comparator is enabled and the dsPIC33E/PIC24E device is placed in Sleep mode, the comparator remains active. If the comparator interrupt is enabled in the interrupt module, it remains functional. Under these conditions, a comparator interrupt event will wake up the device from Sleep mode.

Each operational comparator consumes additional current. To minimize power consumption in Sleep mode, turn off the comparators before entering Sleep mode by disabling the CON bit (CMxCON<15>). If the device wakes up from Sleep mode, the contents of the CMxCON register are not affected. For more information on Sleep mode, refer to the “dsPIC33E/PIC24E Family Reference Manual”, “Watchdog Timer and Power-Saving Modes” (DS70615).

5.2 Interrupt Operation During Idle Mode

The comparator remains active in Idle mode. Comparator interrupt operation during Idle mode is controlled by the Comparator Idle Mode (PSIDL) bit (CMSTAT<15>). If PSIDL = 0, normal interrupt operation continues. If PSIDL = 1, the comparator continues to operate, but it does not generate interrupts.

For more information on Idle mode, refer to the “dsPIC33E/PIC24E Family Reference Manual”, “Watchdog Timer and Power-Saving Modes” (DS70615).

5.3 Effects of a Reset State

A device Reset forces the CMxCON register to its Reset state, causing the comparators to be turned off (CON = 0). However, the input pins multiplexed with analog input sources are configured as analog inputs by default on a device Reset. The I/O configuration for these pins is determined by the setting of the ANSElx register. Therefore, device current is minimized when analog inputs are present at Reset time.
5.4 Analog Input Connection Considerations

A simplified circuit for an analog input is illustrated in Figure 5-1. A maximum source impedance of 10 kΩ is recommended for the analog sources. Any external component connected to an analog input pin, such as a capacitor or a Zener diode, should have little leakage current.

Figure 5-1: Comparator Analog Input Model

**Legend:**

- \( C_{PIN} \) = Input Capacitance
- \( I_{LEAKAGE} \) = Leakage Current at the pin due to various junctions
- \( R_{IC} \) = Interconnect Resistance
- \( R_{S} \) = Source Impedance
- \( V_{A} \) = Analog Voltage
6.0  OP AMP CONFIGURATION

Devices with the op amp/comparator module can be configured as op amps by setting the OPMODE (CMxCON<10>) bit. When set, this bit enables the output of the op amp on the OAxOUT pin for the external gain/filtering components to be added in the feedback path to either of the op amp inputs.

With the proper configuration of the ADC module, the op amps can be configured such that the ADC can directly sample the output of the op amp without the need to route the op amp output to a separate analog input pin. Refer to the “dsPIC33E/PIC24E Family Reference Manual”, “Analog-to-Digital Converter (ADC)” (DS70621) for more information on configuring the ADC. Figure 6-1 describes this configuration, which is referred to as Configuration A.

Figure 6-1:  Op Amp Configuration A

As shown in Figure 6-2, there is a second possible configuration for the op amps, which is referred to as Configuration B. In this configuration, the op amp is not connected internally to the ADC. Instead, the op amp output is routed to a separate analog input pin (ANx). On certain device families, this configuration provides an added benefit of increasing the performance of the op amps. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for performance information.

Figure 6-2:  Op Amp Configuration B
Figure 6-3 illustrates an example of a typical 3-phase motor control application taking advantage of the op amps. In this example, the op amps sample the current through the shunt resistors, with the output of the op amps connected directly to the ADC module, representing Configuration A as previously described in Figure 6-1.

**Figure 6-3: Op Amp Application Usage Diagram**

**Note 1:** Modules inside the dotted boxes are op amp/comparator modules.

**Note 2:** Other components are shown to depict the usage of op amp/comparator modules in an application.
7.0 COMPARATOR VOLTAGE REFERENCE GENERATOR

The internal comparator voltage reference is derived from a 16-tap resistor ladder network that provides a selectable voltage level, as illustrated in Figure 7-1. This resistor network generates the internal voltage reference for the analog comparators. Figure 7-1 shows the block diagram for the op amp/comparator voltage reference for devices with a single 16-tap resistor ladder network.

This voltage generator network is managed by the Comparator Voltage Reference Control (CVRxCON) register (see Register 2-7 and Register 2-8) through these control bits:

- **CVREN** – Comparator Voltage Reference Enable bit (CVRxCON<7>)
  
  This control bit enables the voltage reference circuit.

- **CVRxOE** – Comparator Voltage Reference Output Enable bit (CVRxCON<6>)
  
  This control bit enables the reference voltage to be placed on the CVREF pin. When enabled, this bit overrides the corresponding TRISx bit setting.

- **VREFSEL** – Voltage Reference Select bit (CVR1CON<10>)
  
  This control bit specifies whether the reference source is external (VREF+) or it is obtained from the 4-bit DAC output.

- **VREFSEL** – Voltage Reference Select bit (CVR2CON<10>)
  
  This control bit specifies whether the internal voltage reference (4-bit DAC output) is from CVR1 or CVR2.

- **CVRSS** – Comparator Voltage Reference Source Selection bit (CVRxCON<4>)
  
  This control bit specifies that the source (CVRSS) for the voltage reference circuit is either the device voltage supply (AVDD and AVSS) or an external reference (VREF+ and VREF-).

- **CVRR<1:0>** – Comparator Voltage Reference Range Selection bits (CVRxCON<11,5>)\(^{(1)}\)
  
  These control bits select one of the two voltage ranges covered by the 16-tap resistor ladder network:
  - 0 CVRSRC to 0.94 CVRSRC
  - 0.33 CVRSRC to 0.96 CVRSRC
  - 0 CVRSRC to 0.67 CVRSRC
  - 0.25 CVRSRC to 0.75 CVRSRC
  
  The range selected also determines the voltage increments available from the resistor ladder taps (see Section 7.1 “Configuring the Comparator Voltage Reference”).

- **CVR<3:0>** – Comparator Voltage Reference Value Selection bits (CVRxCON<3:0>)\(^{(2)}\)
  
  These bits designate the resistor ladder tap position.

  Table 7-1 lists the voltage at each tap for both ranges with CVRSSRC = 3.3V.

---

**Note 1:** These bits are not available on all devices. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for availability.

**Note 2:** Comparator Voltage Reference Value Selection bits may vary in different devices depending on the DAC resolution. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for availability.
Figure 7-1: Op Amp/Comparator Voltage Reference Block Diagram for Devices with Two DACs

Note: Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for the available voltage reference functionality.
**Figure 7-2: Op Amp/Comparator Voltage Reference Block Diagram for Devices with a Single DAC**

Note: Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for the available voltage reference functionality.

| 1111     | 0.46875           |

Note 1: CVRR<1:0> bits are not available on all devices. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for availability.

Note 2: Comparator Voltage Reference Value Selection bits, CVR<3:0>, may vary in different devices depending on the DAC resolution. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for availability.
7.1 Configuring the Comparator Voltage Reference

The voltage range selected by the CVRR<1:0> bits (CVRxCON<11,5>) determines the size of the steps selected by the CVR<3:0> bits (CVRxCON<3:0>). The equations used to calculate the comparator voltage reference are as follows:

If CVRR<1:0> = 11:
\[
CVREF = \left(\frac{CVR<3:0>}{16}\right) \times (CVRSRC)
\]

If CVRR<1:0> = 10:
\[
CVREF = \frac{1}{3} \times (CVRSRC) + \left(\frac{CVR<3:0>}{24}\right) \times (CVRSRC)
\]

If CVRR<1:0> = 01:
\[
CVREF = \left(\frac{CVR<3:0>}{24}\right) \times (CVRSRC)
\]

If CVRR<1:0> = 00:
\[
CVREF = \frac{1}{4} \times (CVRSRC) + \left(\frac{CVR<3:0>}{32}\right) \times (CVRSRC)
\]

Devices with a single Comparator Voltage Reference Range Selection bit, CVRR (CVRxCON<5>), the equations used to calculate the comparator voltage reference are as follows:

If CVRR = 1:
\[
\text{Voltage Reference} = \left(\frac{CVR<3:0>}{24}\right) \times (CVRSRC)
\]

If CVRR = 0:
\[
\text{Voltage Reference} = \left(\frac{CVRSRC}{4}\right) + \left(\frac{CVR<3:0>}{32}\right) \times (CVRSRC)
\]

Devices with no Comparator Voltage Reference Range Selection bit, the equation used to calculate the comparator voltage reference is as follows:
\[
\text{Voltage Reference} = \left(\frac{CVR<3:0>}{16}\right) \times (CVRSRC)
\]

7.2 Voltage Reference Accuracy/Error

The full voltage reference range cannot be realized because the transistors on the top and bottom of the resistor ladder network (Figure 7-1) keep the voltage reference from approaching the reference source rails. The voltage reference is derived from the reference source; therefore, the voltage reference output changes with fluctuations in the reference source. For reference voltage accuracy, refer to the “Electrical Characteristics” chapter of the specific device data sheet.

7.3 Operation During Sleep Mode

When the device wakes up from Sleep mode, through an interrupt or a Watchdog Timer time-out, the contents of the CVRxCON register are not affected. To minimize current consumption in Sleep mode, the voltage reference should be disabled.

7.4 Effects of a Reset

A device Reset has the following effects:

- Disables the voltage reference by clearing the CVREN bit (CVRxCON<7>)
- Disconnects the reference from the CVREF pin by clearing the CVRxE bit (CVRxCON<6>)
- Selects the high-voltage range by clearing the CVRRe bit (CVRxCON<11,5>)
- Clears the CVRx value bits (CVRxCON<3:0>)
7.5 Connection Considerations

The voltage reference generator operates independently of the comparator. The output of the reference generator is connected to the CVREF pin if the CVROE bit (CVRCON<6>) is set. Enabling the voltage reference output onto the I/O when it is configured as a digital input will increase current consumption. Configuring the port associated with CVREF as a digital output, with CVRSS enabled, will also increase current consumption.

The CVREF output pin can be used as a simple Digital-to-Analog output with limited drive capability. Due to this limited current drive capability, a buffer may be needed on the voltage reference output for external connections to CVREF. Figure 7-3 illustrates a buffering technique example. Refer to the “Comparator” or “Op Amp/Comparator” chapter in the specific device data sheet for the current drive capability.

Figure 7-3: Comparator Voltage Reference Output Buffer Example

Note 1: \( R \) is dependent upon the Comparator Voltage Reference Control bits, CVRR<1:0> (CVRxCON<11:5>), and CVR<3:0> value bits (CVRxCON<3:0>).
8.0 RELATED APPLICATION NOTES

This section lists application notes that are related to this section of the manual. These application notes may not be written specifically for the dsPIC33E/PIC24E device family, but the concepts are pertinent, and could be used with modification and possible limitations. The current application notes related to the Op Amp/Comparator module are:

<table>

</table>

Note: Visit the Microchip Web site (www.microchip.com) for additional application notes and code examples for the dsPIC33E/PIC24E family of devices.
9.0 REVISION HISTORY

Revision A (November 2008)
This is the initial released version of this document.

Revision B (April 2010)
This version of the document includes the following updates:
• Replaced Figure 26-1: Comparator I/O Operating Modes
• Updated Register 26-2: CMxCON: Comparator x Control Register:
  - Changed the default POR values for the COE, COUT and EVPOL<1:0> bits
  - Updated the selection encoding tables for the CREF and CCH<1:0> bits
  - Updated the CREF = 1 definition
  - Updated the CCH<1:0> = 11 definition
• Updated Register 26-3: CMxMSKSRCSRC: Comparator x Mask Source Select Control Register:
  - Renamed the SELSRC_A, SELSRC_B and SELSRC_C bits to SELSRCA, SELSRCB and SELSRC
  - Changed the bit value definitions for SELSRCA, SELSRCB and SELSRC
• Updated Register 26-4: CMxMSKCON: Comparator x Mask Gating Control Register:
  - Removed the word, ‘inverted’, from the OCEN, OBEN, ACEN and ABEN bit definitions
• Updated Register 26-5: CMxMSKCON: Comparator x Mask Gating Control Register:
• Added Note 1, Note 2 and Note 3, and updated the CFSEL<2:0> bits definition in
  Register 26-5: CMxFLTR: Comparator x Filter Control Register
• Updated the bit value definitions for the VREFSEL and BGSEL<1:0> bits in
  Register 26-6: CVRCON: Comparator Voltage Reference Control Register

Revision C (July 2011)
This version of the document includes the following updates:
• Document has been updated to include both op amp and comparator features. Updates include:
  - Updated Section 26.1 “Introduction” to include the description for the op amp/comparator module
  - Updated Figure 26-1
  - Added Figure 26-2 for op amp/comparator I/O operating modes
  - Updated bit 4 and bits<1-0> in Register 26-2 to include settings applicable for the comparator, as well as the op amp module
  - Added paragraphs about op amp/comparator features in Section 26.3 “Comparator Operation”
  - Added “It is recommended to first configure the CMxCON register with all bits to the desired value, and then set the CON bit (CMxCON<15>).”, which provides information on how the comparator module can be operated as an op amp
  - Added Section 26.6 “Op Amp Configuration”
• Added Figure 26-5
• Updated Register 26-1
• Minor updates in Register 26-3 through Register 26-6
• Updated the comparator register map (see Table 26-2)
• Minor updates to formatting and text have been incorporated throughout the document
Revision D (December 2011)

This version of the document includes the following updates:

- Updated Section 26.1 “Introduction”
- Updated the following figures:
  - Figure 26-1
  - Figure 26-2
  - Figure 26-4
  - Figure 26-5
  - Figure 26-9
  - Figure 26-12
- Removed Figure 26-6
- Updated all registers (see Register 26-1 through Register 26-6)
- Removed the last two paragraphs in Section 26.3 “Comparator Operation”
- Removed Section 26.4.2 “Comparator as an Op Amp”
- Removed Section 26.4.9 “Low-Power Selection”
- Removed Figure 26-7: Comparator Configuration for Op Amp/Comparator Module and Figure 27-8: Op Amp Configuration for Op Amp/Comparator Module
- Updated Section 26.4 “Comparator Configuration”
- Added Op Amp Configuration A and Op Amp Configuration B diagrams (see Figure 26-7 and Figure 26-8)
- Relocated Section 26.6 “Comparator Interrupts” to Section 26.5 “Comparator Interrupts”
- Removed the Op Amp/Comparator Register Map (Table 26-2)

Revision E (June 2013)

Major changes in this version (including Section number being removed from the title):

- CVR1CON and CVR2CON Registers (Register 2-7 and Register 2-8) are included
- Table 7-1 is updated
- Figure 7-1 is changed

Other minor changes:

- A few notes have been added
- Minor updates to formatting and text have been incorporated throughout the document
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Microchip makes no representations or warranties of any kind whether express or implied, written or oral, statutory or otherwise, related to the information, including but not limited to its condition, quality, performance, merchantability or fitness for purpose. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, KEELOQ, KEELOQ logo, MPLAB, PIC, PICmicro, PICSTART, PIC32 logo, rPIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, Hi-TECH C, Linear Active Thermistor, MTP, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

Analog-for-the-Digital Age, Application Maestro, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, Hi-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Omniscent Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PIKit, PIctail, REAL ICE, rLAB, Select Mode, SQI, Serial Quad I/O, Total Endurance, TSHARC, UniWinDriver, WiperLock, ZENA and Z-Scale are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

GestIC and ULPP are registered trademarks of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
