Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip’s products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV
ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company’s quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOC® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Preface

NOTICE TO CUSTOMERS

All documentation becomes dated, and this manual is no exception. Microchip tools and documentation are constantly evolving to meet customer needs, so some actual dialogs and/or tool descriptions may differ from those in this document. Please refer to our web site (www.microchip.com) to obtain the latest documentation available.

Documents are identified with a “DS” number. This number is located on the bottom of each page, in front of the page number. The numbering convention for the DS number is “DSXXXXXA”, where “XXXXX” is the document number and “A” is the revision level of the document.

For the most up-to-date information on development tools, see the MPLAB® IDE on-line help. Select the Help menu, and then Topics to open a list of available on-line help files.

INTRODUCTION

This user’s guide supports the dsPIC30F Acoustic Echo Cancellation Library. Information is provided to help you incorporate acoustic echo cancellation capability into your embedded solution.

Items discussed in this chapter include:

- Document Layout
- Conventions Used in this Guide
- Warranty Registration
- Recommended Reading
- The Microchip Web Site
- Development Systems Customer Change Notification Service
- Customer Support
- Document Revision History

DOCUMENT LAYOUT

This User’s Guide is organized as follows:

- **Chapter 1. “Introduction”** – This chapter introduces the dsPIC30F Acoustic Echo Cancellation Library and provides a brief overview of acoustic echo cancellation. It also outlines requirements for a host PC, dsPIC30F device resource requirements and specific dsPIC30F devices that support the AEC Library. Finally, it provides information on the optional AEC Accessory Kit.

- **Chapter 2. “Installation”** – This chapter provides instructions for installing the Library files and describes the contents of the source files, include files, demo files and archive files.

- **Chapter 3. “Application Programming Interface”** – This chapter provides detailed information needed to interface the AEC Library to a user application on a dsPIC30F device.
CONVENTIONS USED IN THIS GUIDE

This manual uses the following documentation conventions:

WARRANTY REGISTRATION

Please complete the enclosed Warranty Registration Card and mail it promptly. Sending in the Warranty Registration Card entitles users to receive new product updates. Interim software releases are available at the Microchip web site.

RECOMMENDED READING

This user’s guide describes how to use the dsPIC30F Acoustic Echo Cancellation Library. Other useful documents include:

dsPIC30F Family Reference Manual (DS70046)
Consult this document for detailed information on dsPIC30F device operation. This reference manual explains the operation of the dsPIC30F DSC family architecture and peripheral modules but does not cover the specifics of each device. Refer to the appropriate device data sheet for device-specific information.

dsPIC30F Data Sheet, Motor Control and Power Conversion Family (DS70082)
Consult this document for detailed information on the dsPIC30F Motor Control and Power Conversion devices. Reference information found in this data sheet includes:
- Device memory map
- Device pinout and packaging details
- Device electrical specifications
- List of peripherals included on the device

dsPIC30F Data Sheet, General Purpose and Sensor Families (DS70083)
Consult this document for detailed information on the dsPIC30F Sensor and General Purpose devices. Reference information found in this data sheet includes:
- Device memory map
- Device pinout and packaging details
- Device electrical specifications
- List of peripherals included on the device

dsPIC30F5011, dsPIC30F5013 Data Sheet, High-Performance Digital Signal Controllers (DS70116B)
This data sheet contains specific information for the dsPIC30F5011/5013 Digital Signal Controller (DSC) devices.

dsPIC30F6011, dsPIC30F6012, dsPIC30F6013, dsPIC30F6014 Data Sheet, High-Performance Digital Signal Controllers (DS70117B)
This data sheet contains specific information for the dsPIC30F6011/6012/6013/6014 Digital Signal Controller (DSC) devices.

This manual is a software developer’s reference for the dsPIC30F 16-bit DSC family of devices. This manual describes the instruction set in detail and also provides general information to assist you in developing software for the dsPIC30F DSC family.

dsPIC30F Family Overview, High-Performance 16-Bit Digital Signal Controller (DS70043)
This document provides an overview of the functionality of the dsPIC³ product family. Its purpose is to help you determine how the dsPIC 16-bit Digital Signal Controller Family fits your specific product application. This document is a supplement to the dsPIC30F Family Reference Manual.
MPLAB® ASM30, MPLAB® LINK30 and Utilities User’s Guide (DS51317)
This document helps you use Microchip Technology’s language tools for dsPIC®
devices based on GNU technology. The language tools discussed are:
• MPLAB ASM30 Assembler
• MPLAB LINK30 Linker
• MPLAB LIB30 Archiver/Librarian
• Other Utilities

MPLAB® C30 C Compiler User’s Guide (DS51284)
This document helps you use Microchip’s MPLAB C30 C compiler for dsPIC devices to
develop your application. MPLAB C30 is a GNU-based language tool, based on source
code from the Free Software Foundation (FSF). For more information about the FSF,
see www.fsf.org.

Other GNU language tools available from Microchip are:
• MPLAB ASM30 Assembler
• MPLAB LINK30 Linker
• MPLAB LIB30 Librarian/Archiver

MPLAB® IDE Simulator, Editor User’s Guide (DS51025)
Consult this document for more information pertaining to the installation and
implementation of the MPLAB Integrated Development Environment (IDE) software.

To obtain any of these documents, contact the nearest Microchip sales location (see
back page) or visit the Microchip web site at:

Microsoft® Windows® Manuals
This user’s guide assumes that you are familiar with the Microsoft Windows operating
system. Many excellent references exist for this software program and should be
consulted for general operation of Windows.

THE MICROCHIP WEB SITE
Microchip provides online support via our web site at www.microchip.com. This
web site is used as a means to make files and information easily available to
customers. Accessible by using your favorite Internet browser, the web site contains
the following information:
• Product Support – Data sheets and errata, application notes and sample
  programs, design resources, user’s guides and hardware support documents,
  latest software releases and archived software
• General Technical Support – Frequently Asked Questions (FAQs), technical
  support requests, online discussion groups, Microchip consultant program
  member listing
• Business of Microchip – Product selector and ordering guides, latest Microchip
  press releases, listing of seminars and events, listings of Microchip sales offices,
  distributors and factory representatives
DEVELOPMENT SYSTEMS CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip’s customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

The Development Systems product group categories are:

- **Compilers** – The latest information on Microchip C compilers and other language tools. These include the MPLAB C18 and MPLAB C30 C compilers; MPASM™ and MPLAB ASM30 assemblers; MPLINK™ and MPLAB LINK30 object linkers; and MPLIB™ and MPLAB LIB30 object librarians.

- **Emulators** – The latest information on Microchip In-Circuit Emulators. This includes the MPLAB ICE 2000 and MPLAB ICE 4000.

- **In-Circuit Debuggers** – The latest information on the Microchip In-Circuit Debugger, MPLAB ICD 2.

- **MPLAB® IDE** – The latest information on Microchip MPLAB IDE, the Windows® Integrated Development Environment for development systems tools. This list is focused on the MPLAB IDE, MPLAB SIM simulator, MPLAB IDE Project Manager and general editing and debugging features.

- **Programmers** – The latest information on Microchip programmers. These include the MPLAB PM3 and PRO MATE® II device programmers and the PICSTART® Plus and PICkit™ 1 development programmers.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com

In addition, there is a Development Systems Information Line which lists the latest versions of Microchip’s development systems software products. This line also provides information on how customers can receive currently available upgrade kits.

The Development Systems Information Line numbers are:

1-800-755-2345 – United States and most of Canada
1-480-792-7302 – Other International Locations
DOCUMENT REVISION HISTORY

Revision A (July 2004)
• Initial Release of this document.

Revision B (April 2005)
• Updated to reflect added sample rate conversion functions and corresponding demo changes.
Chapter 1. Introduction

1.1 INTRODUCTION

This chapter introduces the dsPIC30F Acoustic Echo Cancellation Library. This Library provides a function to eliminate echo generated in the acoustic path between a speaker and a microphone. This manual provides information you need to incorporate acoustic echo cancellation capability into your embedded solution.

1.2 HIGHLIGHTS

This chapter includes information on these topics:
- Acoustic Echo Cancellation Overview
- Features
- Host System Requirements
- Device Support
- Accessory Kit

1.3 ACOUSTIC ECHO CANCELLATION OVERVIEW

Acoustic echo cancellation eliminates echoes generated in the acoustic path between a speaker and a microphone, as illustrated in Figure 1-1. Acoustic echo cancellation is useful for speech and telephony applications in which a microphone is located near a speaker and is susceptible to output from the speaker. Such acoustic echoes result in a perceptible and distracting echo effect at the far end.

FIGURE 1-1: ACOUSTIC ECHO CANCELLATION
Acoustic echo cancellation is especially suitable for applications such as:

- Hands-free cell phone kits
- Speakerphones
- Intercoms
- Teleconferencing systems

For hands-free phones intended to be used in automotive environments, such as a car cabin, this Library is fully compliant with the G.167 Standard for Acoustic Echo Cancellation.

The Acoustic Echo Cancellation (AEC) Library is written entirely in assembly language and is highly optimized to make extensive use of the dsPIC30F DSC instruction set and advanced addressing modes. The algorithm avoids data overflow. The AEC Library provides an `AcousticEchoCancellerInit` function for initializing the various data structures required by the algorithm and an `AcousticEchoCanceller` function to remove the echo component from a 10-ms block of sampled 16-bit speech data. You can easily call both functions through a well-documented Application Programmer's Interface (API).

The `AcousticEchoCanceller` function is primarily a Time Domain algorithm. The received far-end speech samples (typically received across a communication channel, such as a telephone line) are filtered using an adaptive Finite Impulse Response (FIR) filter. The coefficients of this filter are adapted using the Normalized Least Mean Square (NLMS) algorithm, such that the filter closely models the acoustic path between the near-end speaker and the near-end microphone (i.e., the path traversed by the echo). Voice Activity Detection (VAD) and Double Talk Detection (DTD) algorithms are used to avoid updating the filter coefficients when there is no far-end speech and also when there is simultaneous speech from both ends of the communication link (double talk). As a consequence, the algorithm functions correctly even in the presence of full-duplex communication. A Nonlinear Processor (NLP) algorithm is used to eliminate residual echo.

The dsPIC30F Acoustic Echo Cancellation Library uses an 8-kHz sampling rate. However, the Library includes a conversion function that ensures interoperability with libraries designed for higher sampling rates (9.6 kHz, 11.025 kHz or 12 kHz). The conversion function allows incoming signals at higher sampling rates to be converted to a representative 8-kHz sample. Similarly, the conversion function allows the output signal to be converted upward from 8 kHz to match the user application.
1.4 FEATURES

Key features of the dsPIC30F Acoustic Echo Cancellation Library include:

- Simple user interface – only one library file and one header file
- All functions can be called from a C or assembly application program
- Five user functions:
  - AcousticEchoCancellerInit
  - AcousticEchoCanceller
  - InitRateConverter
  - SRC_upConvert
  - SRC_downConvert
- Full compliance with the Microchip dsPIC30F C30 Compiler, Assembler and Linker
- Highly optimized assembly code that uses DSP instructions and advanced addressing modes
- Echo cancellation for 16, 32 or 64-ms echo delays or “tail lengths” (configurable)
- Fully tested for compliance with G.167 specifications for in-car applications
- Audio Bandwidth: 0 to 4 kHz at 8-kHz sampling rate
- Convergence Rate: Up to 43 dB/sec., typically greater than 30 dB/sec.
- Echo Cancellation: Up to 50 dB, typically > 40 dB
- Can be used together with the Noise Suppression (NS) Library, since the same processing block size (10 ms) is used
- Library User’s Guide is provided to help the user understand and use the Library
- Demo application source code is provided with the Library
- Accessory Kit available for purchase (see Section 1.7 “Accessory Kit”).

1.5 HOST SYSTEM REQUIREMENTS

The AEC Library requires a PC-compatible system with these attributes:

- Intel® Pentium® class or higher processor, or equivalent
- 16 MB RAM (minimum)
- 40 MB (minimum) available hard drive space
- Microsoft® Windows® 98, Windows 2000 or Windows XP

1.6 DEVICE SUPPORT

The AEC Library is supported by these dsPIC30F devices:

- dsPIC30F6014
- dsPIC30F6012
- dsPIC30F5013 (for a maximum of 32-ms echo delay)
- dsPIC30F5011 (for a maximum of 32-ms echo delay)
1.7 ACCESSORY KIT

An optional Acoustic Accessory Kit (Part# AC300030) includes these items:

- 6 ft. Audio Cable (1/8" stereo)
- Headset
- Two 14.7456-MHz Oscillators
- Microphone
- Speaker
- 6 ft. DB9 M/F RS-232 Cable
- DB9M-DB9M Null Modem Adaptor
Chapter 2. Installation

2.1 INTRODUCTION

This section describes the various files in the AEC Library and includes instructions for installing the Library on your laptop or PC for use with dsPIC30F programming tools.

2.2 HIGHLIGHTS

This chapter includes information on these topics:
- Installation Procedure
- Library Archive
- Include Files
- Demo Files
- User’s Guide

2.3 INSTALLATION PROCEDURE

The dsPIC30F AEC Library is packaged on a CD. It can also be purchased and downloaded from the Microchip web site. To install the Library, follow these steps:

1. Insert the Library CD into the appropriate drive and start the setup procedure. If you downloaded the Library from the Microchip web site, run aec.exe from the download location. The installation screen displays, as shown in Figure 2-1.

FIGURE 2-1: INSTALLATION SCREEN
2. Decide where to install the files (the default location is the root of your hard drive), then click OK to continue.

3. Review the License Agreement (Figure 2-2), then click OK to continue.

**FIGURE 2-2: PROGRAM LICENSE AGREEMENT**

![License Agreement dialog box](image)

---

4. When the Installation Complete message displays (Figure 2-3), click OK.

**FIGURE 2-3: INSTALLATION COMPLETE MESSAGE**

![Installation Complete message](image)

---

### 2.4 LIBRARY ARCHIVE

The AEC V2.0\lib folder contains the dsPIC30F Acoustic Echo Cancellation Library files described in Table 2-1.

**TABLE 2-1: LIB FILES**

<table>
<thead>
<tr>
<th>Files in Lib Folder</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>libaec.a</td>
<td>Acoustic Echo Cancellation Library archive file (includes all Library functions)</td>
</tr>
<tr>
<td>librc.a</td>
<td>Sample rate conversion archive file (includes sample rate conversion functions)</td>
</tr>
</tbody>
</table>
2.5 INCLUDE FILES

This folder contains the include files for the dsPIC30F Acoustic Echo Cancellation Library, as listed in Table 2-2. After installation, both the include files are located in the AEC v2.0\inc folder.

<table>
<thead>
<tr>
<th>Files in Inc Folder</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aec.h</td>
<td>This file is the Acoustic Echo Cancellation Library header file used by application programs written in C. The file contains constant parameters used by the C application program, as well as C function prototypes of the two user-callable functions, AcousticEchoCancellerInit and AcousticEchoCanceller. The maximum echo tail length to be cancelled is specified in this file.</td>
</tr>
<tr>
<td>aec.inc</td>
<td>This file is the Acoustic Echo Cancellation Library header file used by application programs written in assembly language. The file contains constant parameters used by the assembly language application program, as well as function prototypes of the two user-callable functions, AcousticEchoCancellerInit and AcousticEchoCanceller. The maximum echo tail length to be cancelled is specified in this file.</td>
</tr>
</tbody>
</table>

2.6 DEMO FILES

The source, include, MPLAB project and workspace files, as well as a ready-to-use hex file (echodemo.hex) and cof file (echodemo.cof), are provided in the AEC v2.0\demo folder. This folder also contains a local copy of the libaec.a and aec.h files, which are used by the demo to avoid any project tool path dependencies, as well as a speech recording wave file for evaluation purposes. Table 2-3 describes the files in this folder.

<table>
<thead>
<tr>
<th>Files in Demo Folder</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>libaec.a</td>
<td>Precompiled library archive file that contains all the Acoustic Echo Cancellation Library functions.</td>
</tr>
<tr>
<td>librc.a</td>
<td>Precompiled library archive file that contains all the sample rate conversion functions.</td>
</tr>
<tr>
<td>lin2ulaw.c</td>
<td>C file that contains μ-law compression functions.</td>
</tr>
<tr>
<td>ulaw2lin.c</td>
<td>C file that contains μ-law decompression functions.</td>
</tr>
<tr>
<td>lcd_strings.c</td>
<td>C file that contains definitions for LCD messages.</td>
</tr>
<tr>
<td>aec_8k.c</td>
<td>C file that contains the main functions for the Acoustic Echo Cancellation demo with 8-kHz sampling rate.</td>
</tr>
<tr>
<td>aec_96k.c</td>
<td>C file that contains the main functions for the Acoustic Echo Cancellation demo with 9.6-kHz sampling rate.</td>
</tr>
<tr>
<td>aec_11k.c</td>
<td>C file that contains the main functions for the Acoustic Echo Cancellation demo with 11-kHz sampling rate.</td>
</tr>
<tr>
<td>aec_12k.c</td>
<td>C file that contains the main functions for the Acoustic Echo Cancellation demo with 12-kHz sampling rate.</td>
</tr>
<tr>
<td>echodemo.cof</td>
<td>Ready-to-use cof file for the Acoustic Echo Cancellation demo.</td>
</tr>
<tr>

2.7 USER’S GUIDE

The “dsPIC30F Acoustic Echo Cancellation Library User’s Guide” is located in the AEC v2.0\doc folder. This document can also be downloaded from the Acoustic Echo Cancellation Library product page on the Microchip web site (www.microchip.com).
Chapter 3. Application Programming Interface

3.1 INTRODUCTION

This section outlines how the functions provided in the AEC Library can be used by user application software, via an Application Programming Interface.

3.2 HIGHLIGHTS

This chapter includes information on these topics:
- Acoustic Echo Cancellation Library Functions
- Sample Rate Conversion Library Functions
- Function Prototypes and Arguments

3.3 ACOUSTIC ECHO CANCELLATION LIBRARY FUNCTIONS

The AEC Library consists of the two functions listed below, which can be called from a user application. The user program(s) that utilizes these functions can be written either in ‘C’ or dsPIC30F assembly language.

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Purpose</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>AcousticEchoCancellerInit</td>
<td>To initialize the data structures used by this function.</td>
<td>Called by the user only once, before the first usage of the function.</td>
</tr>
<tr>
<td>AcousticEchoCanceller</td>
<td>To cancel out the acoustic echo component from a 10-ms block of signal samples.</td>
<td>Called by the user once for every 10-ms block of signal samples.</td>
</tr>
</tbody>
</table>

3.4 SAMPLE RATE CONVERSION LIBRARY FUNCTIONS

The Sample Rate Conversion (SRC) Library consists of the three user-called functions listed in Table 3-2. The user program(s) can be written in ‘C’ or dsPIC30F assembly language.

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Purpose</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>InitRateConverter ()</td>
<td>Initializes data structures used by SRC routines.</td>
<td>Typically called by the user only once.</td>
</tr>
<tr>
<td>SRC_upConvert ()</td>
<td>Interpolation function.</td>
<td>Typically called by user once every 10 ms.</td>
</tr>
<tr>
<td>SRC_downConvert ()</td>
<td>Decimation function.</td>
<td>Typically called by user once every 10 ms.</td>
</tr>
</tbody>
</table>
3.5 FUNCTION PROTOTYPES AND ARGUMENTS

The prototypes, along with a description of the arguments used by each function, are given below. The 'C' function prototypes are defined in the header file, aec.h. For each function, the actual name of the Library function, as would be used when it is called from a user application written in assembly language, is also listed.

3.5.1 AEC Initialization Function

Function prototype, when the function is invoked from 'C'

```c
void AcousticEchoCancellerInit (long *echo_mem,
   int order, long *vad_mem,
   long *scratch_mem, int howling_control );
```

**Note:** These five arguments must be successively assigned to W0, W1, W2, W3 and W4, respectively, before the function can be called.

Function call, when the function is invoked from assembly language

```assembly
CALL _AcousticEchoCancellerInit
```

**Note:** The RCALL instruction may be used instead of CALL, when the conditions for usage of the RCALL instruction are satisfied.
### Function Arguments

**Description:**

- **echo_mem**
  
  Pointer to a block of static variables in RAM utilized by the AEC algorithm. This memory block needs to be allocated by the user application. Its length is defined in the `aec.h` header file (used if the calling application routine is written in 'C') and the `aec.inc` include file (used if the calling application routine is written in assembly). It is dependent on the maximum echo tail length for which the echo needs to be eliminated.

  In order to configure the appropriate echo tail length, the `echo_delay` constant in the `aec.h` or `aec.inc` file must be modified by the user.

  The `echo_mem` memory block must have a size equal to 
  \[(8 \times \text{echo\_delay}) + 47\] long integers or  
  \[(32 \times \text{echo\_delay}) + 188\] bytes.

  This memory block must be allocated in X data memory.

- **order**
  
  Order of AEC adaptive filter, as given by the constant `ORDER` defined in `aec.h` and `aec.inc`.

  For a signal sampling rate of 8 kHz, 
  \[\text{ORDER} = 8 \times \text{echo\_delay}\].

  The user must pass the constant `ORDER` as the function argument.

- **vad_mem**
  
  Pointer to a 304-byte (76 long integers) block of static variables in RAM used by the Voice Activity Detection algorithm (described in the next section). This memory block must be allocated by the user application in X data memory.

- **scratch_mem**
  
  Pointer to a block of RAM utilized by the AEC algorithm. This memory block must be allocated by the user application in X data memory and must have a size equal to 
  \[(\text{ORDER} + (3 \times \text{FRAME}))/2\] long integers, or  
  \[2 \times (\text{ORDER} + (3 \times \text{FRAME}))\] bytes,  
  where `FRAME` = 80 (a constant defined in `aec.h` and `aec.inc`), which represents the number of signal samples in each 10-ms processing frame.

- **Howling_control**
  
  This argument determines if the optional Howling Control feature will be enabled. If the value passed is '1', then Howling Control is enabled; if it is '0', then Howling Control is disabled.

  **Note:** For 64-ms echo tail length, this argument must be '0' (i.e., Howling Control is not supported for 64-ms echo tail length).

**Return Value:** None
3.5.2 AEC Frame Processing Function

**Function prototype, when the function is invoked from ‘C’**

```c
void AcousticEchoCanceller (long *echo_mem, long *vad_mem,
   int *rin_in, int *sin_in, int *sout,
   int inhibit_flag, int *yscrptr);
```

**Note:** These seven arguments must be successively assigned to W0, W1, W2, W3, W4, W5 and W6, respectively, before the function can be called.

**Function call, when the function is invoked from assembly language**

```assembly
CALL _AcousticEchoCanceller
```

**Note:** The RCALL instruction may be used instead of CALL, when the conditions for usage of the RCALL instruction are satisfied.

**Function Arguments**

**Input Arguments:**

- **echo_mem**: Pointer to a block of static variables in RAM utilized by the AEC algorithm. This memory block needs to be allocated by the user application. Its length is defined in the aec.h header file (used if the calling application routine is written in ‘C’) and the aec.inc include file (used if the calling application routine is written in assembly). It is dependent on the maximum echo tail length for which the echo needs to be eliminated.

  In order to configure the appropriate echo tail length, the echo_delay constant in the aec.h or aec.inc file must be modified by the user.

  The echo_mem memory block must have a size equal to

  
  ```
  ((8 * echo_delay) + 47) long integers or
  ((32 * echo_delay) + 188) bytes.
  ```

  This memory block must be allocated in X data memory.

- **vad_mem**: Pointer to a 304-byte (76 long integers) block of static variables in RAM used by the Voice Activity Detection algorithm (described in the next section). This memory block must be allocated by the user application in X data memory.

- **rin_in**: Pointer to the RAM buffer containing the current processing frame of 80 samples of the Receive-In (RIN) signal.

- **sin_in**: Pointer to the RAM buffer containing the current processing frame of 80 samples of the Send-In (SIN) signal.
3.5.3 Sample Rate Conversion Initialization Function

```c
int InitRateConverter ( )
```

CALL _InitRateConverter (long *rc_mem, long * scratch_mem, char RateFactor, char enable;

- **inhibit_flag**: A flag variable which determines if adaptation of filter coefficients will be performed for the current processing frame. If the argument value passed is '0', adaptation is inhibited; if the value passed is '1', filter adaptation is performed. This parameter is primarily useful for application debugging purposes. During normal operation, this argument should be '1'.

- **yscrptr**: Pointer to a block of RAM utilized by the AEC algorithm. This memory block must be allocated by the user application in Y data memory and must have a size equal to \((\text{ORDER} + \text{FRAME})\) words or \((2 * (\text{ORDER} + \text{FRAME}))\) bytes, where \text{FRAME} = 80.

**Output Argument:**

- **sout**: Pointer to the RAM buffer containing the current processing frame of 80 samples of the Send-Out (SOUT) signal.

**Return Value:**

None

**Function Arguments**

- **rc_mem**: Pointer to a (user-allocated) block of static variable in X-RAM. Length of this array is \text{RC\_STATE\_MEM\_SIZE}, defined in the include files.

- **scratch_mem**: Pointer to a (user-allocated) block of X-RAM. Length of this array is \text{RC\_SCRATCH\_MEM\_SIZE}, defined in the include files.

- **RateFactor**: Variable to select between different input/output sample rate combinations.

- **char enable**: \text{RC\_ENABLE} or \text{RC\_DISABLE}.

**Return Value:**

1 on success, -1 on failure
3.5.4 Sample Rate Up Conversion Function

```c
int SRC_upConvert ( )
CALL _SRC_upConvert (long *rc_mem, int *input, int FrameLength, int *output)
```

### Function Arguments

**Description:**
- `rc_mem`: Pointer to a (user-allocated) block of static variable in X-RAM. Length of this array is RC_STATE_MEM_SIZE, defined in the include files.
- `input`: Pointer to a (user-allocated) RAM array containing input samples sampled at 8 kHz.
- `FrameLength`: Length of the input array, selected from the following constants defined in include files:
  - L_FRAME_8K (for 8 kHz)
  - L_FRAME_96K (for 9.6 kHz)
  - L_FRAME_11K (for 11.025 kHz)
  - L_FRAME_12K (for 12 kHz)
- `output`: Pointer to a (user-allocated) RAM array containing output sample sampled at 9.6, 11.025 or 12 kHz.

**Return Value:**
- 1 on success, -1 on failure
### 3.5.5 Sample Rate Down Conversion Function

```c
int SRC_downConvert ( )
CALL _SRC_downConvert (long *rc_mem, int *input, int FrameLength,
int *output
```

**Function Arguments**

**Description:**

- **rc_mem**: Pointer to a (user-allocated) block of static variable in X-RAM. Length of this array is RC_STATE_MEM_SIZE, defined in the include files.
- **input**: Pointer to a (user-allocated) RAM array containing input samples sampled at 9.6, 11.025 or 12 kHz.
- **FrameLength**: Length of the input array, selected from the following constants defined in include files:
  - L_FRAME_8K (for 8 kHz)
  - L_FRAME_96K (for 9.6 kHz)
  - L_FRAME_11K (for 11.025 kHz)
  - L_FRAME_12K (for 12 kHz)
- **output**: Pointer to a (user-allocated) RAM array containing output samples sampled at 8 kHz.

**Return Value:**

1 on success, -1 on failure
Chapter 4. Resource Requirements

4.1 INTRODUCTION

This chapter describes the resources required to support the AEC Library.

4.2 HIGHLIGHTS

This chapter includes information on these topics:
• Program Memory Requirements
• Data Memory Requirements
• Computational Speed Requirements

4.3 PROGRAM MEMORY REQUIREMENTS

All look-up tables used by the Library functions are located in program memory.

4.3.1 Acoustic Echo Cancellation

Table 4-1 lists the program memory requirements for Acoustic Echo Cancellation Library functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Memory Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code in Program Memory</td>
<td>5180 bytes</td>
</tr>
<tr>
<td>Tables in Program Memory</td>

</tr>
</tbody>
</table>

4.3.2 Sample Rate Conversion

Table 4-2 lists the program memory requirements for sample rate conversion functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Memory Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code in Program Memory</td>
<td>582 bytes</td>
</tr>
<tr>
<td>Tables in Program Memory</td>
<td>2100 bytes</td>
</tr>
</tbody>
</table>
4.4 DATA MEMORY REQUIREMENTS

The various blocks of data memory that the user application is required to allocate are described in the API description. The number of bytes of RAM used by each of these memory blocks is listed in Table 4-3 for different echo tail lengths (16, 32 and 64 ms). The memory block pointer names used in the API section have been used in this table.

4.4.1 Acoustic Echo Cancellation

</tbody>
</table>

Note: The user application may require an additional 2 KB of RAM for data buffering (application-dependent).
4.4.2 Sample Rate Conversion

Data RAM usage, excluding basic RAM requirements of the Acoustic Echo Cancellation Library, is listed below:

- 150 bytes in Y-RAM
- Up to 240 bytes in either X-RAM or Y-RAM
- Increase in Acoustic Echo Cancellation codec buffering requirements due to sample rate conversion:
  - 0.2 Kbyte for 96-kHz input sampling rate
  - 0.375 Kbyte for 11-kHz input sampling rate
  - 0.5 Kbyte for 12-kHz input sampling rate

4.5 COMPUTATIONAL SPEED REQUIREMENTS

Million Instructions Per Second (MIPS) required on a dsPIC30F device are listed in Table 4-4 for different echo tail lengths (without Howling Control enabled).

4.5.1 Acoustic Echo Cancellation

<table>
<thead>
<tr>
<th>Echo Tail Length</th>

</tbody>
</table>

4.5.2 Sample Rate Conversion

Interpolation Function

- 0.79 MIPS – 8 kHz to 9.6 kHz
- 0.88 MIPS – 8 kHz to 11 kHz
- 0.94 MIPS – 8 kHz to 12 kHz

Decimation Function

- 0.74 MIPS – 9.6 kHz to 8 kHz
- 0.78 MIPS – 11 kHz to 8 kHz
- 0.82 MIPS – 12 kHz to 8 kHz
Chapter 5. Acoustic Echo Cancellation Algorithm

5.1 INTRODUCTION

This chapter describes the Acoustic Echo Cancellation algorithms contained in the AEC Library.

5.2 HIGHLIGHTS

This chapter includes information on these topics:
- AEC Algorithm Overview
- NLMS Algorithm
- Double Talk Detection
- Voice Activity Detection
- Nonlinear Processor
- Howling Control (Optional)

5.3 AEC ALGORITHM OVERVIEW

The Acoustic Echo Cancellation (AEC) algorithm can be divided broadly into these functions:
- Normalized Least Mean Square (NLMS) Adaptation Algorithm
- Double Talk Detector (DTD)
- Voice Activity Detector (VAD)
- Nonlinear Processor (NLP)
- Howling Control

A conceptual block diagram illustrating the operation of the AEC algorithm is shown in Figure 5-1.

FIGURE 5-1: CONCEPTUAL BLOCK DIAGRAM OF AEC ALGORITHM
A typical AEC system involves four signals:

- Far-end speech receive input (RIN)
- Near-end speech send output (SOUT)
- Far-end speech output (ROUT), usually sent to a local speaker
- Near-end speech input (SIN), usually received from a local microphone

In systems in which the near-end speaker and microphone do not have sufficient acoustic separation, the SIN signal not only contains the microphone input (presumably spoken by a talker at the near end), but also an undesirable echo generated by the acoustic path from the speaker to the microphone. This signal is then transmitted to the far end through the communication channel (wired or wireless), with the result that the listener at the other end hears a perceptible echo of his/her own speech. Traditionally, this problem had to be avoided by allowing only one person to talk at any given time (i.e., by not allowing “double talk”).

An Acoustic Echo Cancellation algorithm consists of an adaptive filter and various associated control functions, which not only eliminate the acoustic echo but also enable double talk (i.e., full-duplex operation). This algorithm operates at the same communicating node at which the echo was generated. The control functions used in the AEC algorithm, in conjunction with the Normalized LMS adaptive filter, are Double Talk Detection, Voice Activity Detector, Nonlinear Processor and Howling Control.

Normalized Least Mean Squares (NLMS) is the fundamental adaptation algorithm used for estimating and cancelling out the acoustic echo. However, the filter adaptation should only be performed when a far-end speech signal is received through the communication channel. This decision is taken by the Voice Activity Detector (VAD) block.

Moreover, when the two talkers on both sides (RIN and SIN) speak at the same time, it is known as a double talk condition. During double talk, the SIN signal acts as uncorrelated noise and may cause the adaptive filter to diverge from its desired state, thereby reducing the efficacy of the AEC algorithm. This is prevented by the Double Talk Detection (DTD) block.

A Nonlinear Processor (NLP) block is required to remove any residual echo, because the adaptive filter in itself can not model nonlinearities in the echo path.

### 5.4 NLMS ALGORITHM

Figure 5-2 illustrates the fundamental principle of Acoustic Echo Cancellation. The far-end signal $x(n)$ traverses the acoustic echo path between the speaker and the microphone (with its impulse response represented here as $h$), thereby generating an echo. The signal $y(n)$ is the sum of near-end speech $t(n)$ and the echo. The signal $\hat{y}(n)$ is the near-end signal.

**FIGURE 5-2: GENERIC ECHO CANCELLER**
The AEC algorithm filters the far-end speech \( x(n) \) using a continuously adapting estimate (with its impulse response represented as \( h \)) of the echo path. It then subtracts the output of this estimated echo path from the 'output' (the near-end speech input) of the actual echo path, thereby effectively eliminating the echo from the resultant signal, which can then be transmitted over the communication channel.

5.4.1 Band-Pass Filters

Band-pass filters are used to remove unwanted low-frequency and high-frequency components of the SIN and RIN signals. The cutoff frequencies for both the band-pass filters are 100 Hz and 3.2 kHz.

The band-pass filtering used for this signal preprocessing operation is performed using a cascade of a 2nd order High-Pass Filter (HPF) and a 2nd order Low-Pass Filter (LPF), with the resultant filter transfer function being Equation 5-1:

**EQUATION 5-1:**

\[
S(z) = S_1(z) \cdot S_2(z)
\]

The transfer function for the HPF is given by Equation 5-2:

**EQUATION 5-2:**

\[
S_1(z) = \frac{0.94597 - (1.89195z^{-1} + 0.94597z^{-2})}{1 + 1.88903z^{-1} - 0.89487z^{-2}}
\]

The transfer function for the LPF is given by Equation 5-3:

**EQUATION 5-3:**

\[
S_2(z) = \frac{0.63894 + 1.27789z^{-1} + 0.63894z^{-2}}{1 - (1.14298z^{-1} - 0.41280z^{-2})}
\]

5.4.2 Decorrelation Filters

To avoid degradation of the performance of the NLMS algorithm due to the strong correlations of speech signals, each of the speech inputs are “prewhitened” by applying a Decorrelation Filter, before passing it to the adaptive filter.

A Decorrelation Filter is a prediction error filter with its coefficients matched to the correlation properties of the speech signal. Where speech signals are concerned, this serves to increase the convergence rate of the coefficients of the adaptive filter.

A 1st order Decorrelation Filter is used to decorrelate the input signal:

\[ y(n) = x(n) - (\alpha) \times x(n - 1) \]

An inverse decorrelation filter of the 1st order Decorrelation Filter is used at the other end to recover the signal.

5.4.3 Adaptive Filter

Adaptive step-size control is used to improve the filter performance for speech and to better deal with noisy environments. The step-size \( \mu \) can be calculated for every 10-ms (80-sample) frame based on the residual echo energy from the previous frame:

\[ \text{step\_size} = \frac{1}{1/\text{step\_factor} + \text{prev\_sout\_egy}} \]

where:

- \( \text{step\_size} \) = variable step size used for adaptation of NLMS filter;
- \( \text{prev\_sout\_egy} \) = energy contained in previous frame of residual echo;
- \( \text{step\_factor} \) = constant term corresponding to a step size of 0.732421875.
The purpose of the `prev_sout_energy` term is to decrease the step size during double talk and noisy conditions when the energy of the frame temporarily increases. Therefore, using adaptive step-size control serves to improve the robustness of the adaptive filter.

The impulse response estimate is updated as shown in Equation 5-4.

**EQUATION 5-4:**

\[
\hat{h}_k(n + 1) = \hat{h}_k(n) + \left[ \frac{\mu \cdot e(n)}{N \cdot (E_x(n) + \delta)} \right] \cdot x(n - k)
\]

where:

- \(N\) is the length of the NLMS adaptive filter (512, 256 or 128 taps in this case);
- \(e(n)\) is the difference between the near-end signal \(y(n)\) and the predicted signal \(\hat{y}(n)\), given by Equation 5-5 and Equation 5-6;
- \(\mu\) is referred to as the adaptive filter loop gain or step-size parameter \((0 < \mu < 2\) for NLMS);
- \(\delta\) is a regularization parameter that prevents division by zero; and
- \(E_x(n)\) is the average far-end energy, given by Equation 5-7.

**EQUATION 5-5:**

\[
\hat{y}(n) = \sum_{k=0}^{N-1} \hat{h}_k(n) x(n - k)
\]

**EQUATION 5-6:**

\[
e(n) = y(n) - \hat{y}(n)
\]

**EQUATION 5-7:**

\[
E_x(n) = \frac{1}{N} \sum_{k=0}^{N-1} x^2(n - k)
\]

\(\mu\) should be any value between 0 and 2, so that stability of the NLMS algorithm is ensured. However, a suitable value should be used such that the convergence rate of the adaptation algorithm is fast, divergence rate in the case of double talk is slow and the steady state (residual) error is minimum. The effective value of \(\mu\) used by the algorithm depends on the average far-end energy.

The predicted signal \(\hat{y}(n)\) is obtained by filtering the signal \(x(n)\) with a filter having a transfer function. Thereafter, the error \(e(n)\) is calculated. The average far-end energy \(E_x(n)\) is calculated as described by Equation 5-7.

To optimize the calculations for NLMS filter coefficient updates, the AEC algorithm uses the previously calculated error \(e(n - 1)\) and also uses the previous input signal vector \(x(n - 1)\).
Thus, Equation 5-4 is transformed into:

EQUATION 5-8:

\[
\hat{h}_k(n+1) = \hat{h}_k(n) + \left[\frac{\mu \cdot e(n-1)}{N \cdot E_x(n)}\right] \cdot x(n-1-k)
\]

where \(E_x(n)\) is defined by \(E_x(n) = m2^{\exp} \) (\(m\) is the mantissa and \(\exp\) is the exponent of the floating point value \(E_x(n)\)).

Therefore, Equation 5-8 can also be written as Equation 5-9:

EQUATION 5-9:

\[
\hat{h}_k(n+1) = \hat{h}_k(n) + \left[\frac{\mu \cdot e(n-1) \cdot 2^{-SF} \cdot 2^{-p} \cdot 2^{\exp}}{m}\right] \cdot x(n-1-k)
\]

where:

\[
\begin{align*}
SF &= \log_2(N); \\
p &= 1 \quad \text{for } E_x(n) > 0x00008000; \\
p &= 2 \quad \text{for } 0x00008000 < E_x(n) < 0x00000800; \\
\end{align*}
\]

Effective Adaptation Step Size is \(\mu_p = \mu^{2^{-p}}\).

Thus, the step size is automatically scaled to obtain a low step size when the far-end energy \(E_x(n)\) is low. In general, low far-end energy indicates the absence of far-end speech. When there is no far-end speech, the step size gets reduced to prevent divergence of the filter. The constants, 0x00008000 and 0x800, represent thresholds for far-end energy, based on which the adaptation step size is altered.

Equation 5-9 is used for implementing the adaptation of the NLMS adaptive filter.

The parameters associated with a specified maximum echo delay ‘\(t_d\)’ in ms, for a sampling rate \(F_s\), are shown in Table 5-1.

<table>
<thead>
<tr>
<th>Constant Parameters</th>

<td>(\log_2(N))</td>
</tr>
<tr>
<td>(\delta)</td>
<td>Associated with the implementation of Equation 5-4.</td>
<td>(N)</td>
</tr>
</tbody>
</table>
5.5 DOUBLE TALK DETECTION

Double talk is the condition that occurs as a result of two talkers on both sides (RIN and SIN) talking at the same time. During double talk, the signal SIN acts like uncorrelated noise and may cause the coefficients of the NLMS adaptive filter to diverge, thereby failing to effectively cancel the acoustic echo. To prevent such a condition, a Double Talk Detector (DTD) is used to inhibit adaptation of the filter during periods of simultaneous far-end and near-end speech. In this algorithm, an energy-based double talk detector is used, in which double talk is detected when Average Energy of SOUT > Average Energy of RIN

A hang-over time of one 10-ms frame is specified so that if double talk is detected, the adaptation is inhibited for one frame beyond the detected end of the double talk condition.

5.6 VOICE ACTIVITY DETECTION

Voice Activity Detection (VAD) is used to detect the presence of far-end speech. VAD uses the background noise energy estimate and energy of the current RIN frame to detect speech. A block diagram of the VAD algorithm is shown in Figure 5-3.

5.6.1 High-Pass Filter

A High-Pass Filter with a cutoff frequency of 80 Hz is used to remove DC and other low-frequency components of the far-end speech signal. The output of the HPF is denoted as $s'(n)$.

The transfer function of the LPF is described by Equation 5-10.

**EQUATION 5-10:**

\[
H(z) = 0.5 \frac{0.92727435 - 1.8544941z^{-1} + 0.92727435z^{-2}}{1 - 1.9059465z^{-1} + 0.9114024z^{-2}}
\]
5.6.2 Fast Fourier Transform

The input samples are pre-emphasized using Equation 5-11.

\[
\text{Equation 5-11:} \quad d(n) = s'(n) + \xi (s'(n - 1))
\]

where:

\[\xi = -0.8\]

Pre-emphasized samples are buffered for 10 ms and overlapped with 3 ms of signal samples from the previous frame, thus yielding 104 samples. The resulting buffer is zero-padded with 24 zeros, thereby forming a 128-sample buffer. This buffer is windowed using a smoothed trapezoidal window, as defined in Table 5-2.

<table>
<thead>
<tr>

</tr>
<tr>
<td>(\sin^2(\pi(n - L + D + 0.5)/2D))</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

where:

- \(D\) is the number of overlapped samples from previous frame = 24;
- \(L\) is the number of samples per frame = 80;
- \(M\) is the FFT length = 128.

A 64-point Complex Fast Fourier Transform (FFT) is performed on the 128-point real buffer and some post-processing of the 64-point Complex FFT output is performed in order to obtain a 128-point Real FFT output vector. A detailed description of the post-processing method is given below:

Since the FFT algorithm can handle complex-valued input sequences, we can exploit this capability in the computation of the DFT of two real-valued sequences.

Suppose \(x_1(n)\) and \(x_2(n)\) are two real-valued sequences of length \(N\) and \(x(n)\) is a complex-valued sequence defined as in Equation 5-12:

\[
\text{Equation 5-12:} \quad x(n) = x_1(n) + jx_2(n)
\]

for:

\(0 \leq n \leq N - 1\)

Discrete Fourier Transform (DFT) is a linear operation and hence, the DFT of \(x(n)\) may be expressed as in Equation 5-13:

\[
\text{Equation 5-13:} \quad X(k) = X_1(k) + jX_2(k)
\]
The sequences $x_1(n)$ and $x_2(n)$ can be expressed in terms of $x(n)$ as in Equation 5-14 and Equation 5-15, respectively.

**EQUATION 5-14:**

$$x_1(n) = \frac{(x(n) + x^*(n))}{2}$$

**EQUATION 5-15:**

$$x_2(n) = \frac{(x(n) - x^*(n))}{2}$$

where:

$x^*(n)$ is the conjugate of $x(n)$

Hence, the DFTs of $x_1(n)$ and $x_2(n)$ are expressed as in Equation 5-16 and Equation 5-17.

**EQUATION 5-16:**

$$X_1(n) = \frac{\text{DFT}(x(n)) + \text{DFT}(x^*(n))}{2}$$

**EQUATION 5-17:**

$$X_2(n) = \frac{\text{DFT}(x(n)) - \text{DFT}(x^*(n))}{2j}$$

Since the DFT of $x^*(n)$ is $X^*(N - k)$, the above equations become Equation 5-18 and Equation 5-19, respectively.

**EQUATION 5-18:**

$$X_1(k) = \frac{x(k) + x^*(N - k)}{2}$$

**EQUATION 5-19:**

$$X_2(k) = \frac{x(k) - x^*(N - k)}{2j}$$

Thus, by performing a single DFT on a complex-valued sequence $x(n)$, we have obtained the DFT of two sequences, with only a small amount of additional computation involved in computing $X_1(k)$ and $X_2(k)$ from $X(k)$.

Suppose $g(n)$ is a real-valued sequence of 2 N-points. Let us divide or decimate $g(n)$ into 2 N-point sequences, as given below:

$$x_1(n) = g(2n)$$
$$x_2(n) = g(2n + 1)$$

Thus, we have subdivided the 2 N-point real sequence into two N-point real sequences, on which we can apply the method described above.

Let $x(n)$ be the N-point complex-valued sequence:

$$x(n) = x_1(n) + jx_2(n)$$

Using the above results, we have:

$$X_1(k) = \frac{X(k) + X^*(N - k)}{2}$$
$$X_2(k) = \frac{X(k) - X^*(N - k)}{2j}$$
Finally, we must express the 2 N-point DFT in terms of two N-point DFTs, \( X_1(k) \) and \( X_2(k) \). To accomplish this, we employ a method similar to the decimation in-time FFT algorithm, as shown in Equation 5-20.

\[
EQUATION 5-20:
\]

\[
G(k) = \sum_{n=0}^{N-1} g(2n) W_{2N}^{2nk} + \sum_{n=0}^{N-1} g(2n+1) W_{2N}^{2n+1k} \]

\[
= \sum_{n=0}^{N-1} x_1(n) W_N^{nk} + W_{2k}^k \sum_{n=0}^{N-1} x_2(n) W_N^{nk} \]

Consequently:

\[
EQUATION 5-21:
\]

\[
G(k) = X_1(k) + W_{2N}^k X_2(k) \]

\[
G(k + N) = X_1(k) - W_{2N}^k X_2(k) \]

where:

\[
k = 0, 1, \ldots, N - 1
\]

Since the sequence is real, its FFT is an even function. Therefore, out of the 128 complex elements in the output, we only need to compute the first 64 elements.
5.6.3 Band Energy Computation

The frequency spectrum of the far-end speech signal (obtained using FFTR as described above) is divided into 16 non-uniform bands. The energy in each band is computed using leaky integration. The spectrum of the signal is divided as shown in Table 5-3:

<table>
<thead>
<tr>

</tbody>
</table>

Each band energy is independently computed as in Equation 5-22:

**EQUATION 5-22:**

\[
E_{ch}(m,i) = \max \left\{ E_{\text{min}}, \alpha_{ch} E_{ch}(m-1,i) + (1 - \alpha_{ch}) \sum_{k = f_{L}(i)}^{f_{H}(i)} |G(k)|^2 \right\}
\]

where:
- \(\alpha_{ch} = 0\) for first frame and 0.55 for all other frames;
- \(E_{\text{min}} = 0.0625\), \(G(k)\) is the FFT of the input signal; and
- \(m\) denotes the current 

```bash

```
5.6.4 Band SNR Computation

For each of the frequency bands, the Signal-to-Noise Ratio (SNR) is computed using:

a) the signal band energy computed in the band energy computation stage, and
b) the noise band energy estimate (which is updated during noise only frames).

For each frequency band, the SNR thus obtained is used to compute the corresponding scale factor.

If \( E_n(m,i) \) is the noise energy estimate for frame \( m \), then the scale factor for band \( i \) is given by:

\[
\sigma(i) = \max \left\{ 0, \text{round} \left( 10 \log \left( \frac{E_{ch}(m,i)}{E_n(m,i)} \right) \right) \right\}
\]

5.6.5 VAD and Noise Band Energy Computation

The band energies of the current Rin frame and the noise band energies are compared in order to classify the current frame as either a 'noise frame' or a 'speech frame'. A hangover of six frames is applied for transition from speech frames to noise frames. If the current frame is declared as a noise frame by the VAD function, then the noise band energy is updated.

For the first 12 frames, the noise band energy is updated continuously using band energy, irrespective of whether these frames are noise only frames or noisy speech frames.

The following procedure is used to determine if the current frame is a noise only frame.

a) A count is set to zero. Each signal band energy is compared with the corresponding noise band energy.

b) If the signal band energy is greater than 1.5 times noise band energy, the count is incremented.

c) If the count is greater than 5 for the current frame (i.e., if 5 of the 16 band energies are more than 1.5 times the corresponding noise band energies), the current frame is declared as a speech frame.

Otherwise, the current frame is determined to be a noise frame and the noise band energy is updated using the leaky integration method given by Equation 5-24.

\[
E_n(m + 1, i) = \max \{ E_{\text{min}} \cdot (\alpha_n E_n(m,i)) + (1 - \epsilon_n) E_{\text{ch}}(m,i) \} \quad 0 \geq 1 > N_c
\]
5.7 NONLINEAR PROCESSOR

The AEC algorithm by itself may not be capable of adequately modeling echo paths that generate significant levels of nonlinear distortion. This necessitates the usage of a Nonlinear Processor (NLP).

The function of the NLP is to substantially suppress the residual echo level which remains at the output of the NLMS adaptive filter, so that a very low returned echo level can be achieved even if the echo path is nonlinear. The NLP is located in the send path between the output of the NLMS filter and the SOUT port of the system. The NLP basically attenuates low-level signals (which are assumed to be residual echo) by 18 dB and passes high-level signals (which are assumed to be desirable near-end speech).

A hang-over count of three frames (30 ms) is applied from the time a double talk condition is detected.

5.8 HOWLING CONTROL (OPTIONAL)

Howling is a typical problem in full-duplex communication. It builds up due to the acoustic feedback path. One way to reduce howling is to shift the frequency of the signal that is picked up by the microphone by 10 Hz to 20 Hz, before it is sent out over a communication channel. This shift is usually not perceived as unnatural by the human ear. The shifted signal appears at the destination loudspeakers and travels back to the originator, shifted by another 10 Hz to 20 Hz. The signal travels many times through this acoustic path and is quickly shifted out of the pass band, thus reducing the problem of unpleasant feedback. A block diagram of the Howling Control function is shown in Figure 5-4.

FIGURE 5-4: HOWLING CONTROL ALGORITHM

The up sampler fills in three zeros between the adjacent signal samples \( x(n) \) and \( x(n+1) \).

The band-pass filter operates at four times the sampling frequency of input, retaining the components of the spectrum that are supposed to be frequency shifted by \( \pm f_h \) Hz. The actual shift is performed by multiplication with an appropriate cosine signal. The band-pass filter removes some artifacts that appear due to the shifting operation and the down sampler takes every fourth sample of the band-pass result to yield the output signal at the original sampling rate.

The cutoff frequencies of the 1st band-pass filter are 8.1 kHz and 11.3 kHz, and the cosine signal used for the shifting operation is a \((8000 - f_h) \) Hz signal. The band-pass filter used here is a 10th order IIR filter. This 10th order filter is implemented as a cascade of five 2nd order filters.

The cutoff frequencies of the 2nd band-pass filter are 100 Hz and 3.3 kHz. The band-pass filter used here is a 4th order IIR filter, which is implemented as a cascade of two 2nd order filters.
The transfer function of a general Nth order IIR filter is given by Equation 5-25:

\[
H(z) = \sum_{k=0}^{N-1} b_k z^{-k} \frac{1 \sum_{k=1}^{N-1} a_k z^{-k}}{1}
\]

where:

- \( N \) = order of the IIR filter;
- \( b_k \) = zeros of the IIR filter (b coefficients);
- \( a_k \) = poles of the IIR filter (a coefficients).

The transfer function of a 2nd order IIR filter is given by Equation 5-26:

\[
H(z) = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2}}{1 - (a_1 z^{-1} + a_2 z^{-2})}
\]

The signal flow graph of a second order IIR filter, implemented in DIRECT FORM 1, is shown in Figure 5-5.

The transfer function \( G(z) \) of the first band-pass filter (BPF_1) can be expressed as in Equation 5-27:

\[
G(z) = H_1 \cdot H_2 \cdot H_3 \cdot H_4 \cdot H_5
\]

The transfer function of the 1st stage of BPF_1 is given by Equation 5-28:

\[
H_1(z) = \frac{1 - 0.00035 z^{-1} - 0.0245184 z^{-2}}{1 - 0.5200 z^{-1} - 0.5095 z^{-2}}
\]
The transfer function of the 2nd stage of BPF_1 is given by Equation 5-29:

**EQUATION 5-29:**

\[
H_2(z) = \frac{0.18286 - 0.3660z + 0.18314z^{-2}}{1 - 0.23306z^{-1} - 0.57366z^{-2}}
\]

The transfer function of the 3rd stage of BPF_1 is given by Equation 5-30:

**EQUATION 5-30:**

\[
H_3(z) = \frac{0.14946 - 0.29883z^{-1} + 0.14937z^{-2}}{1 - 0.83368z^{-1} - 0.61961z^{-2}}
\]

The transfer function of the 4th stage of BPF_1 is given by Equation 5-31:

**EQUATION 5-31:**

\[
H_4(z) = \frac{0.38245 - 0.76503z^{-1} + 0.38257z^{-2}}{1 - 0.06182z^{-1} - 0.81573z^{-2}}
\]

The transfer function of the 5th stage of BPF_1 is given by Equation 5-32:

**EQUATION 5-32:**

\[
H_5(z) = \frac{0.50020 + z^{-1} + 0.49980z^{-2}}{1 - 1.09887z^{-1} - 0.849007z^{-2}}
\]

Similarly, the second band-pass filter (BFF_2) can be expressed as:

**EQUATION 5-33:**

\[
T(z) = T_1 \cdot T_2
\]

The transfer function of the 1st stage of BPF_2 is given by Equation 5-34:

**EQUATION 5-34:**

\[
T_1(z) = \frac{0.068460 + 0.13692z^{-1} + 0.06846z^{-2}}{1 + 1.1500138z^{-1} - 0.42438z^{-2}}
\]

The transfer function of the 2nd stage of BPF_2 is given by Equation 5-35:

**EQUATION 5-35:**

\[
T_2(z) = \frac{0.98531 - 1.9706z^{-1} + 0.06846z^{-2}}{1 + 1.1500138z^{-1} - 0.42438z^{-2}}
\]
6.1 INTRODUCTION

This chapter provides a hands-on demonstration of acoustic echo cancellation in a working application.

6.2 HIGHLIGHTS

This chapter includes information on these topics:
- Demonstration Summary
- Demonstration Setup
- Demonstration Procedure
- Demo Code Description

6.3 DEMONSTRATION SUMMARY

To demonstrate the functionality of the AEC Library, a sample application emulating two speaker phones engaged in voice communication is provided with the Library. This software requires the use of two dsPICDEM™ 1.1 boards (not included with the software license). The two dsPICDEM 1.1 development boards are configured as typical communication nodes using the components included in the optional Accessory Kit, as shown in Figure 6-1. The RS-232 cable with a null modem adapter serves as the communication channel.

FIGURE 6-1: ACOUSTIC ECHO CANCELLATION DEMONSTRATION

A speaker and a microphone are connected to dsPICDEM 1.1 Board #1 and located in proximity to each other. A headset is connected to Board #2. When a person talks into the headset connected to Board #2, the speech signal is sampled through the on-board Si3000 voice band codec and the Data Converter Interface (DCI) module of the dsPIC30F device. The dsPIC30F device then compresses the signal, using μ-Law compression and transmits the compressed speech signal through its UART1 module and the on-board RS-232 transceiver to Board #1.

The dsPIC30F device on Board #1 receives the signal through the on-board RS-232 transceiver and the device’s UART1 module and decompresses the signal using μ-Law decompression. The dsPIC30F device then plays out the signal on the speaker through its DCI module and on-board Si3000 codec. Due to the proximity of the speaker to the microphone, the sound from the speaker enters the microphone and is sampled by the
dsPIC30F device through the codec. The device then compresses the microphone input signal and transmits it to Board #2 via the RS-232 interface. If a person is talking into the microphone connected to Board #1, the signal transmitted to Board #2 is a combination of the near-end speech and the undesirable acoustic echo of the far-end speech. This combination of speech and echo can be heard on the headset connected to Board #2.

The AEC function is automatically turned on and off every ten seconds using a timer (Timer 1) on the dsPIC30F device. When started, the program initializes with AEC turned off, indicated by LED1 turned off. With AEC off, the signal heard in the headset contains noticeable acoustic echo. After ten seconds, AEC is enabled and LED1 is turned on. At this point, the acoustic echo generated between the speaker and the microphone is eliminated. The headset on Board #2 now hears only the speech signal from the Board #1 microphone. The AEC algorithm, now activated, has cancelled out the echo.

The LCD displays an approximation of the average Echo Return Loss Enhancement (ERLE) as a result of echo cancellation.

**FIGURE 6-2: PROGRAM STATUS DISPLAY**

| AEC Indicator LED1 | Avg ERLE = 50 dB |

### 6.4 DEMONSTRATION SETUP

Follow these steps to set up the demonstration.

#### 6.4.1 Configure dsPICDEM 1.1 Boards

1. Insert a 14.7456-MHz oscillator into oscillator socket U6 on both dsPICDEM 1.1 boards, as shown in Figure 6-3. You can use the two oscillators included in the Accessory Kit or supply your own.

2. Set the jumper marked J9 to the ‘Master’ position on both boards. This jumper allows the on-board Si3000 codec to function as a serial clock master using the 14.7456-MHz oscillator.

3. Apply power to both boards.

**FIGURE 6-3: DEMO BOARD SETUP**

- Install Oscillator on Both Boards
- Set J9 to Master
6.4.2 Setup Demo

After both boards are properly configured, attach the speakers and microphones and interconnect the boards, as shown in Figure 6-4. These instructions assume you are using components from the optional Accessory Kit. You can use equivalent devices if you choose.

FIGURE 6-4: CONNECT dsPICDEM™ 1.1 BOARDS

1. Connect the fold-up speaker to the SPKR OUT jack (J17) on Board #1.
2. Connect the lapel microphone to the MIC IN jack (J16) on Board #1. Be sure the microphone is turned on and is situated close enough to the speaker to generate feedback into the microphone.
3. Connect the headset microphone to the MIC IN (J16) jack on Board #2.
4. Connect the headset speaker to the SPKR OUT (J17) jack on Board #2.
5. Connect one end of the DB9M-DB9M Null Modem Adapter to PORTB (J5) on Board #1. Then, connect one end of the RS-232 cable to the Null Modem Adapter.
6. Connect the other end of a 6 ft. DB9 M/F RS-232 cable to the ‘PORTB’ (J5) port on Board #2.

6.4.3 Program dsPIC30F Device

After the boards are configured and interconnected, you must build a project in MPLAB IDE to program the demonstration software into the dsPIC30F devices on the dsPICDEM 1.1 boards. Follow these steps:

1. Open MPLAB IDE. Open the echodemo.mcw workspace or echodemo.mcp project located in the Demo folder.
2. Select Project->Build All to build the project.
   Alternatively, open MPLAB IDE, select dsPIC30F6014 as the device, select ICD 2 as the programmer, and import the echodemo.hex file from the Demo folder. For more information on using MPLAB IDE, refer to “dsPIC® Language Tools Getting Started” (DS70094).
3. Connect the ICD 2 to dsPICDEM 1.1 Board #1. Program the dsPIC30F6014 device on the board (Programmer->Program).
   The project output window displays programming status, as shown in Figure 6-5.
4. Connect ICD 2 to dsPICDEM 1.1 Board #2 and program the dsPIC30F6014 device.
5. Disconnect the ICD 2 from both boards. Make sure that the two boards are not located too close to each other in order to avoid any acoustic coupling between the two boards.
6.5 DEMONSTRATION PROCEDURE

After the demo application has been programmed into both devices, the demo is ready to run. Follow these steps to run the demo:

1. Press the Reset button on both dsPICDEM 1.1 boards. The same code should now be running on both boards.
2. Put on the headset connected to dsPICDEM 1.1 Board #2 and listen for a beep. This beep indicates that the codec has been initialized.
3. Start talking on the microphone input of the headset. On the speaker output of the headset, you should be able to hear an echo of your own speech.
4. If you wish, have someone simultaneously talk into the microphone connected to dsPICDEM 1.1 Board #1. In this case, you would hear the other person’s speech as well as an echo of your own speech.
5. Press the switch marked ‘SW1’ on dsPICDEM 1.1 Board #1. Observe that the LED1 on Board #1 turns on, indicating that the AEC algorithm is active.
6. Again, speak into the microphone of the headset. You should no longer hear the echo of your own speech.
7. To observe echo cancellation during double talk, let a person simultaneously talk into the microphone connected to dsPICDEM 1.1 Board #1. You will only hear the other person’s speech, free of the echo of your own speech.

Alternatively, instead of talking into the headset, you can drive an audio wav file from the speaker output of a computer to the microphone input of dsPICDEM 1.1 Board #2 through a 6 ft. stereo audio cable (you can use the audio cable included in the Accessory Kit). A speech recording (good_sp.wav) is provided for this purpose. Turn on the Repeat function in the Media Player on your PC to allow the wave file to run continuously.

To experiment with different values of maximum echo tail length, simply change the echo_delay constant defined in the aec.h include file, rebuild echodemo.mcp, reprogram the two devices and rerun the demo application.
To experiment with different input sampling rates, replace files aec_8k.c, dci_isr_8k.s, si3000_8k.s and uart_8k.s in the Project with the suitable set of four files for the desired sampling rate. Then rebuild and reprogram the code.

6.6 DEMO CODE DESCRIPTION

A brief description of the demo code is given below, with special focus on the initialization of key peripherals such as DCI and UART. It can be executed for maximum echo tail length of 64 ms (with 64 ms being the default setting of the echo_delay constant). The same demo code runs on two dsPIC30F6014 devices, both using the primary oscillator as the clock source, with the XT w/PLL 16x Primary Oscillator mode.

aec_8k.c contains the main function for the demo application. aec_8k.c allocates all the variables and arrays in data memory that are needed for DCI and UART data buffering, as well as the blocks of data memory that need to be allocated for the AEC Library functions. indatabuffer and outdatabuffer are UART input and output buffers. indataRIndex, indataWIndex, outdataRIndex and outdataWIndex are Read and Write indices for the indatabuffer and outdatabuffer arrays. CodecRxBuffer and CodecTxBuffer are the receive and transmit buffers for codec data.

The main function calls the AcousticEchoCencellerInit function from the AEC Library, which initializes the AEC algorithm.

The main function also calls the Init_DCI() function to initialize the DCI module, the Si3000 codec and DCI interrupt. The DCI module acts as a slave and the Si3000 codec acts as a master and drives the serial clock and frame synchronization lines. The DCI module is set for the Multi-Channel Frame Sync Operating mode, with 16-bit data words and 16 data words or time slots per frame, of which only one transmit slot and one receive slot are used in this demo.

Subsequently, the Init_si3000() function is used to initialize the Si3000 codec. The codec is reset by connecting the RF6 pin of the dsPIC30F device to the Reset pin of the Si3000, holding RF6 low for 200 cycles and then bringing it high. The codec is configured for a sample rate of 8 kHz. Two 14.7456-MHz oscillators are used for driving the Si3000 codec on both the boards. The MIC Gain and Receive Gain are set to 0 db. Both the speakers are set to active and the Transmit Gain is set to 12 db. The Analog Attenuation parameter is set to 0 dB. After initializing all the Si3000 control registers, a delay is introduced for calibration to occur. Finally, the DCI interrupt is enabled.

UART initialization and data processing is performed by the init_uart function. The UART module is configured to generate an interrupt for every byte transmitted or received. The UART module is run at a baud rate of 115200 bps, with an 8-bit, no parity, 1 Stop bit data format (8-N-1). In the UART Transmit and Receive Interrupt Service Routines, the corresponding interrupt flag is cleared, data is either written to U1TXREG, or read from U1RXREG and saved in a circular buffer. Note that the UART code also allows the user to use an RS-422 cable (instead of an RS-232 cable and Null Modem Adapter) if a greater degree of acoustic isolation is required between the two boards.

The intr_count variable is incremented every time a DCI interrupt occurs. When the count is 80, the contents of the codec data buffers are copied into the rinfbuff and sinbuff arrays, and the AcousticEchoCanceller function from the AEC Library is called. rinfbuff contains the far-end input data to be played out on the speaker and sinbuff contains the near-end microphone input. The buffering delay is compensated by using an appropriate offset. The sout data buffer, which is the output of the AcousticEchoCanceller function, is compressed using μ-law compression and transmitted using the UART1 module to the other end of the communication link.
Display on the LCD is made possible by initialization of the SPI™ module in the _InitSPI function, and LCD driver functions and LCD string definitions present in the lcd.s and lcd_strings.c files. To toggle the AEC on/off control flag (aecflag), Timer 1 is initialized in the timer1_init.c file, and the ISR for the timer interrupt is located in the timers_interrupt.c file.

Every ten seconds, the AEC algorithm is alternately enabled and disabled and LED1 is turned on and off. A flag, aecflag, is toggled in the ISR __T1Interrupt. In the main loop, the value of this flag is tested. If the flag is set, the AEC output is played out to the speaker output of the headset. Otherwise, the microphone input signal from the headset is directly played out on the speaker output of the headset.
