Section 1. Introduction

HIGHLIGHTS

This section of the manual contains the following topics:

1.1 Introduction ................................................................. 1-2
1.2 Device Structure .......................................................... 1-3
1.3 Development Support .................................................. 1-4
1.4 Style and Symbol Conventions ....................................... 1-5
1.5 Related Documents ....................................................... 1-6
1.6 Revision History ........................................................... 1-7
1.1 INTRODUCTION

Microchip is a leading provider of microcontrollers and analog semiconductors. The company’s focus is on products that meet the needs of the embedded control market. We are a leading supplier of the following products:

- 8-bit general purpose microcontrollers (PICmicro® MCUs)
- 16-bit microcontrollers
- dsPIC® 16-bit digital signal controllers (DSCs)
- Specialty and standard non-volatile memory devices
- Security devices (KEELOQ®)
- Application-specific standard products

Please request a Microchip Product Line Card for a listing of the products that we have to offer. This literature can be obtained from your local sales office or downloaded from the Microchip web site (www.microchip.com).

Part 1 of this manual describes the following dsPIC33F 16-bit DSC devices:

- dsPIC33FJ64GP206
- dsPIC33FJ64GP306
- dsPIC33FJ64GP310
- dsPIC33FJ64GP706
- dsPIC33FJ64GP708
- dsPIC33FJ64GP710
- dsPIC33FJ64MC506
- dsPIC33FJ64MC508
- dsPIC33FJ64MC510
- dsPIC33FJ64MC706
- dsPIC33FJ64MC710
- dsPIC33FJ128GP206
- dsPIC33FJ128GP306
- dsPIC33FJ128GP310
- dsPIC33FJ128GP706
- dsPIC33FJ128GP708
- dsPIC33FJ128GP710
- dsPIC33FJ128MC506
- dsPIC33FJ128MC510
- dsPIC33FJ128MC706
- dsPIC33FJ128MC710

This manual explains the operation of the dsPIC33F DSC family architecture and peripheral modules, but does not cover the specifics of each device. Refer to the data sheet for device specific information. The information that can be found in the data sheet includes the following:

- Device memory map
- Device pinout and packaging details
- Device electrical specifications
- List of peripherals included on the device

Code examples are given throughout this manual. These examples are for reference purposes only and may need to be modified to suit a specific processor or MPLAB® tools version.
1.2 DEVICE STRUCTURE

Each part of the dsPIC device can be placed into one of the following groups:

- CPU Core
- System Integration
- Peripherals

1.2.1 CPU Core

The CPU core pertains to the basic features required to make the device operate. The following sections of Part 1 of the manual relate to the CPU core:

- Section 2. “CPU”
- Section 3. “Data Memory”
- Section 4. “Program Memory”
- Section 6. “Interrupts”

1.2.2 System Integration

System integration functions help to accomplish the following:

- Decrease system cost
- Increase system reliability
- Increase design flexibility

The following sections of Part 1 of the manual discuss dsPIC33F system integration functions:

- Section 5. “Flash Programming”
- Section 7. “Oscillator”
- Section 8. “Reset”
- Section 9. “Watchdog Timer and Power-Saving Modes”
- Section 23. “CodeGuard™ Security”
- Section 24. “Programming and Diagnostics”
- Section 25. “Device Configuration”

1.2.3 Peripherals

The dsPIC device has many peripherals that allow it to be interfaced to external circuitry. Peripherals are discussed in the following sections of the manual:

- Section 10. “I/O Ports”
- Section 11. “Timers”
- Section 12. “Input Capture”
- Section 13. “Output Compare”
- Section 14. “Motor Control PWM”
- Section 15. “Quadrature Encoder Interface (QEI)”
- Section 16. “10/12-bit ADC with DMA”
- Section 28. “10/12-bit ADC without DMA”
- Section 17. “UART”
- Section 18. “SPI™”
- Section 19. “I²C™”
- Section 20. “Data Converter Interface”
- Section 21. “ECAN”
- Section 22. “Direct Memory Access (DMA)”
1.3 DEVELOPMENT SUPPORT

Microchip offers a wide range of development tools that allow you to efficiently develop and debug application code. Microchip's development tools generally fall into the following categories:

• Code generation
• Hardware and software debugging
• Device programming
• Product development boards

A full description of each of Microchip's development tools is provided in Section 26. "Development Tool Support." As new tools are developed, the latest product briefs and user guides can be obtained from the Microchip web site (www.microchip.com) or from your local Microchip Sales Office.

Microchip offers other development support in the following forms:

• Application Notes
• Reference Designs
• Microchip web site
• Local sales offices with Field Application Engineering support
• Corporate support line

The Microchip web site (www.Microchip.com) lists other sites that may be useful references.
Section 1. Introduction

1.4 STYLE AND SYMBOL CONVENTIONS

Throughout this document, certain style and font format conventions are used. Most format conventions imply a distinction should be made for the emphasized text. The MCU industry uses many symbols and non-conventional word definitions and abbreviations. Table 1-1 provides a description for many of the conventions contained in this document. Located at the rear of this document, a glossary provides additional word and abbreviation definitions used throughout this manual.

Table 1-1 defines some of the symbols and terms used throughout this manual.

Table 1-1: Document Conventions

<table>
<thead>
<tr>
<th>Symbol or Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set</td>
<td>To force a bit/register to a value of logic ‘1’.</td>
</tr>
<tr>
<td>clear</td>
<td>To force a bit/register to a value of logic ‘0’.</td>
</tr>
</tbody>
</table>
| Reset         | 1) To force a register/bit to its default state.  
               2) A condition in which the device places itself after a device Reset occurs. Some bits will be forced to ‘0’ (such as interrupt enable bits), while others will be forced to ‘1’ (such as the I/O data direction bits). |
| 0xnn or nnh   | Designates the number ‘nn’ in the hexadecimal number system. These conventions are used in the code examples. For example, the designation 0x13F or 13Fh may be used. |
| B’bbbbbbbbbb’ | Designates the number ‘bbbbbbbb’ in the binary number system. This convention is used in the text and in figures and tables. For example, the designation B’10100000’ may be used. |
| R-M-W         | Read-Modify-Write. This occurs when a register or port is read, the value is modified, and that value is then written back to the register or port. This action can occur from a single instruction (such as bit set, BSET) or a sequence of instructions. |
| : (colon)     | Used to specify a range or the concatenation of registers/bits/pins. One example is TMR3:TMR2, which is the concatenation of two 16-bit registers to form a 32-bit timer value. Concatenation order (left-right) usually specifies a positional relationship (MSb to LSb, higher to lower). |
| < >           | Specifies bit(s) locations in a particular register. One example is PTCON<PTMOD1:PTMOD0> (or PTMOD<1:0>), which specifies the register and associated bits or bit positions. |
| MSb, LSb      | Indicates the Least Significant or Most Significant bit in a field. |
| MSB, MSW, LSB, LSW | Indicates the Least/Most Significant Byte or Word in a field of bits. |
| Courier Font  | Used for code examples, binary numbers and for instruction mnemonics that appear in the text. |
| Times Font    | Used for equations and variables. |
| Times, Bold Font, Italics | Used in explanatory text for items called out from a graphic/equation/example. |
| Note          | A Note presents information that we wish to re-emphasize, either to help you avoid a common pitfall or to make you aware of operating differences between some device family members. A Note is always in a shaded box (as below), unless used in a table, where it is at the bottom of the table (as in this table). |

Note: This is a Note in a shaded note box.
1.5 RELATED DOCUMENTS

Microchip, as well as other sources, offers additional documentation that can aid in your development with dsPIC33F DSCs. The following lists contain the most common documentation, but other documents may also be available.

1.5.1 Microchip Documentation

The following dsPIC documentation is available from Microchip at the time of this writing. Many of these documents provide application-specific information that gives actual examples of using, programming and designing with dsPIC MCUs. Please check the Microchip web site (www.microchip.com) for the latest published technical documentation.

1. dsPIC30F/33F Programmer’s Reference Manual (DS70157)
   This reference manual provides information about the dsPIC programmer’s model and instruction set. A description of each instruction, along with syntax examples, is provided in this document.

2. dsPIC33FJxxx GPx06/x08/x10 Data Sheet (DS70286)
   This document provides a summary of the available dsPIC33F family variants that are best suited for general purpose applications. This document includes device pinouts, memory sizes and available peripherals.

3. dsPIC33FJxxx MCx06/x08/x10 Data Sheet (DS70287)
   This document provides a summary of the available dsPIC33F family variants that are best suited for motor control applications. This document includes device pinouts, memory sizes and available peripherals.

1.5.2 Third Party Documentation

There are several documents available from third-party sources around the world. Microchip does not review these documents for technical accuracy. However, they may be a helpful source for understanding the operation of Microchip dsPIC devices. Please refer to the Microchip web site for third party documentation related to the dsPIC.
1.6 Revision History

Revision A

This is the initial release of this document.
