The PIC® microcontrollers you have received all exhibit anomalous behavior in their Synchronous Serial Port (SSP) modules, as described in this document. They otherwise conform functionally to the descriptions provided in their respective Device Data Sheets and Reference Manuals, as amended by silicon release errata for particular devices.

Users are encouraged to review the latest device data sheets and errata available for additional information concerning an individual device. These documents may be obtained directly from the Microchip corporate web site, at www.microchip.com.

Silicon Errata

These issues are expected to be resolved in future silicon revisions of the designated parts.

The silicon issues identified in this “Silicon Errata” section affect all silicon revisions of the following devices:

- PIC14000
- PIC16C62
- PIC16C62A
- PIC16C62B
- PIC16C63
- PIC16C63A
- PIC16C64
- PIC16C64A
- PIC16C65
- PIC16C65B
- PIC16C66
- PIC16C67
- PIC16C717
- PIC16C72
- PIC16C72A
- PIC16C73
- PIC16C73A
- PIC16C73B
- PIC16C74
- PIC16C74A
- PIC16C74B
- PIC16C76
- PIC16C77
- PIC16C923
- PIC16C924
- PIC16C925
- PIC16C926
- PIC16CR62
- PIC16CR63
- PIC16CR64
- PIC16CR65
- PIC16CR72
- PIC16CR72A
- PIC16F72
- PIC16F73
- PIC16F74
- PIC16F76
- PIC16F77
- PIC16F87
- PIC16F88
- PIC16F818
- PIC16F819
- PIC18F2331
- PIC18F2431
- PIC18F4331
- PIC18F4431

1. Module: \( ^2 \text{C} \) (Slave Mode)

In its current implementation, the module may fail to correctly recognize certain Repeated Start conditions. For this discussion, a Repeated Start is defined as a Start condition presented to the bus after an initial valid Start condition has been recognized and the Start status bit (SSPSTAT<3>) has been set and before a valid Stop condition is received.

If a Repeated Start is not recognized, a loss of synchronization between the Master and Slave may occur; the condition may continue until the module is reset. A NACK condition, generated by the Slave for any reason, will not reset the module.

This failure has been observed only under two circumstances:

- A Repeated Start occurs within the frame of a data or address byte. The unexpected Start condition may be erroneously interpreted as a data bit, provided that the required conditions for setup and hold times are met.
- A Repeated Start condition occurs between two back-to-back slave address matches in the same Slave, with the \( R/W \) bit set to Read (\( = 1 \)) in both cases. (This circumstance is regarded as being unlikely in normal operation.)

Work around

A time-out routine should be used to monitor the module’s operation. The timer is enabled upon the receipt of a valid Start condition; if a time-out occurs, the module is reset. The length of the time-out period will vary from application to application and will need to be determined by the user.

Two methods are suggested to reset the module:

1. Change the mode of the module to something other than the desired mode by changing the settings of bits, SSPM3:SSPM0 (SSPCON<3:0>); then, change the bits back to the desired configuration.
2. Disable the module by clearing the SSPEN bit (SSPCON<5>); then, re-enable the module by setting the bit.

Other methods may be available.
Clarifications/Corrections to the Data Sheets

1. Module: SSP (SPI Mode)

   **Note:** This correction applies to the Data Sheets for the following devices:
   - PIC16C62B/72A (DS35008B)
   - PIC16C63A/65B/73B/74B (DS30605C)
   - PIC16C923/924 (DS30444E)
   - PIC16C925/926 (DS39544A)
   - PIC16F72 (DS39597B)
   - PIC16F73/74/76/77 (DS30325B)
   - PIC18F2331/2431/4331/4431 (DS39616B)

   In addition, this clarification applies only to the following devices in the PIC16C6X Data Sheet (DS30234D):
   - PIC16C66
   - PIC16C67

   In addition, this clarification applies only to the following devices in the PIC16C7X Data Sheet (DS30390E):
   - PIC16C76
   - PIC16C77

   Any devices not explicitly listed in this section do not implement SPI mode and are not affected by this clarification.

The description of the operation of the CKE bit (SSPSTAT<6>) is clarified. Please substitute the description in Register 1, below, for all occurrences of the existing text for the SSPSTAT register, bit 6 (new text in **bold**).

   **Note:** This text refers only to the operation of the CKE bit in SPI mode; its operation in I^2C mode is unchanged.

**bit 6**  **CKE:** SPI Clock Edge Select bit

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Transmit occurs on transition from active to Idle clock state</td>
</tr>
<tr>
<td>0</td>
<td>Transmit occurs on transition from Idle to active clock state</td>
</tr>
</tbody>
</table>

   **Note:** Polarity of clock state is set by the CKP bit (SSPCON<4>).

2. Module: SSP (SPI Slave Mode)

   **Note:** This correction applies to the Data Sheets for the following devices:
   - PIC16C6X (DS30234D), except PIC16C61 (does not implement the SSP module)
   - PIC16C62B/72A (DS35008B)
   - PIC16C63A/65B/73B/74B (DS30605C)
   - PIC16C72/73/74/74A/76/77 (DS30390E)
   - PIC16C923/924 (DS30444E)
   - PIC16C925/926 (DS39544A)
   - PIC16F72 (DS39597B)
   - PIC16F73/74/76/77 (DS30325B)
   - PIC18F2331/2431/4331/4431 (DS39616B)

   Any other devices not explicitly listed in this section do not implement SPI mode and are not affected by this clarification.

The description of the operation of SPI Slave mode is clarified as follows:

Before enabling the module in SPI Slave mode, the state of the clock line (SCK) must match the polarity selected for the Idle state. The clock line can be observed by reading the SCK pin. The polarity of the Idle state is determined by the CKP bit (SSPCON<4>).

This foregoing text should be added to the appropriate subsections of the “SSP Module” chapter, entitled “SPI Mode” and read in context with any discussions of SPI Slave mode.

In the case of DS30234D, the text applies to both implementations of SPI mode, as described in Sections 11.2 and 11.3.

**REGISTER 1:** SSPSTAT: SSP STATUS REGISTER (EXCERPT)

<table>
<thead>
<tr>
<th>bit 6</th>
<th>CKE: SPI Clock Edge Select bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Transmit occurs on transition from active to Idle clock state</td>
</tr>
<tr>
<td>0</td>
<td>Transmit occurs on transition from Idle to active clock state</td>
</tr>
</tbody>
</table>

   **Note:** Polarity of clock state is set by the CKP bit (SSPCON<4>).
3. Module: SSP (I²C Mode)

Note: This correction applies to the Data Sheets for the following devices:
- PIC14000 (DS40122B)
- PIC16C6X (DS30234D) except PIC16C61 (does not implement SSP module)
- PIC16C62B/72A (DS35008B)
- PIC16C63A/65B/73B/74B (DS30605C)
- PIC16C72/73/73A/74A/76/77 (DS30390E)
- PIC16C923/924 (DS30444E)
- PIC16C925/926 (DS39544A)
- PIC16F72 (DS39597B)
- PIC16F73/74/76/77 (DS30325B)

The description of the I²C pins related to the TRIS bits is clarified. To ensure proper communication of the I²C Slave mode, the TRIS bits (TRISx [SDA, SCL]) corresponding to the I²C pins must be set to ‘1’. If any TRIS bits (TRISx<7:0>) of the port containing the I²C pins (PORTx [SDA, SCL]) are changed in software during I²C communication using a Read-Modify-Write instruction (BSF, BCF), then the I²C mode may stop functioning properly and I²C communication may suspend. Do not change any of the TRISx bits (TRIS bits of the port containing the I²C pins) using the instruction BSF or BCF during I²C communication. If it is absolutely necessary to change the TRISx bits during communication, the following method can be used:

```assembly
MOVF TRISC, W ; Example for a 40-pin part such as the PIC16F73
IORLW 0x18 ; Ensures <4:3> bits are '11'
ANDLW B'11111001' ; Sets <2:1> as output, but will not alter other bits
                    ; User can use their own logic here, such as IORLW, XORLW and ANDLW
MOVWF TRISC
```
REVISION HISTORY

Revision A Document (7/2002):
Original version (I\(^2\)C Slave Issue).

Revision B Document (1/2003):
Clarification of original issue to include Restart conditions. Addition of data sheet clarification 1 (SPI Mode, CKE bit).

Revision C Document (3/2003):
Addition of data sheet clarification 2 (SPI Slave Mode, operation).

Revision D Document (9/2004):

Revision E Document (7/2006):
Removed silicon issue 2 (SSP – SPI Slave Mode).

Revision F Document (2/2007):
Added four devices to list of devices affected by the silicon errata and clarified the related language.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV

ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona, Gresham, Oregon and Mountain View, California. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
