Preface

The ATtiny1627 Curiosity Nano Evaluation Kit is a hardware platform to evaluate microcontrollers in the tinyAVR® 2-series. This board has the ATtiny1627 microcontroller (MCU) mounted.

Supported by Atmel Studio and Microchip MPLAB® X Integrated Development Environments (IDEs), the board provides easy access to the features of the ATtiny1627 to explore how to integrate the device into a custom design.

The Curiosity Nano series of evaluation boards include an on-board debugger. No external tools are necessary to program and debug the ATtiny1627.

- **MPLAB® X IDE** and **Atmel Studio** - Software to discover, configure, develop, program, and debug Microchip microcontrollers.
- **ATtiny1627 website** - Find documentation, sample, and purchase microcontrollers.
- **ATtiny1627 Curiosity Nano website** - Kit information, latest user guide and design documentation.
- **Code examples on GitHub** - Get started with code examples.

1. Introduction

1.1 Features

- ATtiny1627 Microcontroller
- One Yellow User LED
- One Mechanical User Switch
- Footprint for 32.768 kHz Crystal
- On-Board Debugger:
  - Board identification in Atmel Studio/Microchip MPLAB® X IDE
  - One green power and status LED
  - Programming and debugging
  - Virtual serial port (CDC)
  - Two debug GPIO channels (DGI GPIO)
- USB Powered
- Adjustable Target Voltage:
  - MIC5353 LDO regulator controlled by the on-board debugger
  - 1.8-5.1V output voltage (limited by USB input voltage)
  - 500 mA maximum output current (limited by ambient temperature and output voltage)

1.2 Kit Overview

The Microchip ATtiny1627 Curiosity Nano Evaluation Kit is a hardware platform to evaluate the ATtiny1627 microcontroller.

Figure 1-1. ATtiny1627 Curiosity Nano Evaluation Kit Overview
2. Getting Started

2.1 Quick Start
Steps to start exploring the ATtiny1627 Curiosity Nano Board:
1. Download Atmel Studio/Microchip MPLAB® X IDE.
2. Launch Atmel Studio/Microchip MPLAB® X IDE.
3. Optional: Use MPLAB® Code Configurator or Atmel START to generate drivers and examples.
4. Write your application code.
5. Connect a USB cable (Standard-A to Micro-B or Micro-AB) between the PC and the debug USB port on the board.

Driver Installation
When the board is connected to your computer for the first time, the operating system will perform a driver software installation. The driver file supports both 32- and 64-bit versions of Microsoft® Windows® XP, Windows Vista®, Windows 7, Windows 8, and Windows 10. The drivers for the board are included with Atmel Studio/Microchip MPLAB® X IDE.

Kit Window
Once the board is powered, the green status LED will be lit, and Atmel Studio/Microchip MPLAB® X IDE will auto-detect which boards are connected. Atmel Studio/Microchip MPLAB® X IDE will present relevant information like data sheets and board documentation. The ATtiny1627 device on the ATtiny1627 Curiosity Nano Board is programmed and debugged by the on-board debugger and, therefore, no external programmer or debugger tool is required.

Tip: The Kit Window can be opened in MPLAB X IDE through the menu bar Window > Kit Window.

2.2 Design Documentation and Relevant Links
The following list contains links to the most relevant documents and software for the ATtiny1627 Curiosity Nano Board:

- **MPLAB® X IDE** - MPLAB X IDE is a software program that runs on a PC (Windows®, Mac OS®, Linux®) to develop applications for Microchip microcontrollers and digital signal controllers. It is called an Integrated Development Environment (IDE) because it provides a single integrated “environment” to develop code for embedded microcontrollers.
- **Atmel Studio** - Free IDE for the development of C/C++ and assembler code for microcontrollers.
- **IAR Embedded Workbench® for AVR®** - This is a commercial C/C++ compiler that is available for AVR microcontrollers. There is a 30-day evaluation version as well as a 4 KB code-size-limited kick-start version available from their website.
- **MPLAB® Code Configurator** - MPLAB Code Configurator (MCC) is a free software plug-in that provides a graphical interface to configure peripherals and functions specific to your application.
- **Atmel START** - Atmel START is an online tool that hosts code examples, helps the user to select and configure software components, and tailor your embedded application in a usable and optimized manner.
- **Microchip Sample Store** - Microchip sample store where you can order samples of devices.
- **MPLAB Data Visualizer** - MPLAB Data Visualizer is a program used for processing and visualizing data. The Data Visualizer can receive data from various sources such as serial ports and on-board debugger’s Data Gateway Interface, as found on Curiosity Nano and Xplained Pro boards.
- **Studio Data Visualizer** - Studio Data Visualizer is a program used for processing and visualizing data. The Data Visualizer can receive data from various sources such as serial ports, on-board debugger’s Data Gateway Interface as found on Curiosity Nano and Xplained Pro boards, and power data from the Power Debugger.
• **Microchip PIC® and AVR® Examples** - Microchip PIC and AVR Device Examples is a collection of examples and labs that use Microchip development boards to showcase the use of PIC and AVR device peripherals.

• **Microchip PIC® and AVR® Solutions** - Microchip PIC and AVR Device Solutions contains complete applications for use with Microchip development boards, ready to be adapted and extended.

• **ATtiny1627 Curiosity Nano website** - Kit information, latest user guide and design documentation.

• **ATtiny1627 Curiosity Nano on Microchip Direct** - Purchase this kit on Microchip Direct.
3. **Curiosity Nano**

Curiosity Nano is an evaluation platform of small boards with access to most of the microcontrollers I/Os. The platform consists of a series of low pin count microcontroller (MCU) boards with on-board debuggers, which are integrated with Atmel Studio/Microchip MPLAB® X IDE. Each board is identified in the IDE. When plugged in, a Kit Window is displayed with links to key documentation, including relevant user guides, application notes, data sheets, and example code. Everything is easy to find. The on-board debugger features a virtual serial port (CDC) for serial communication to a host PC and a Data Gateway Interface (DGI) with debug GPIO pin(s).

3.1 **On-Board Debugger Overview**

ATtiny1627 Curiosity Nano contains an on-board debugger for programming and debugging. The on-board debugger is a composite USB device consisting of several interfaces:

- A debugger that can program and debug the ATtiny1627 in Atmel Studio/Microchip MPLAB® X IDE
- A mass storage device that allows drag-and-drop programming of the ATtiny1627
- A virtual serial port (CDC) that is connected to a Universal Asynchronous Receiver/Transmitter (UART) on the ATtiny1627, and provides an easy way to communicate with the target application through terminal software
- A Data Gateway Interface (DGI) for code instrumentation with logic analyzer channels (debug GPIO) to visualize program flow

The on-board debugger controls a Power and Status LED (marked PS) on the ATtiny1627 Curiosity Nano Board. The table below shows how the LED is controlled in different operation modes.

<table>
<thead>
<tr>
<th>Operation Mode</th>
<th>Power and Status LED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boot Loader mode</td>
<td>The LED blinks slowly during power-up</td>
</tr>
<tr>
<td>Power-up</td>
<td>The LED is ON</td>
</tr>
<tr>
<td>Normal operation</td>
<td>The LED is ON</td>
</tr>
<tr>
<td>Programming</td>
<td>Activity indicator: The LED blinks slowly during programming/debugging.</td>
</tr>
<tr>
<td>Drag-and-drop programming</td>
<td><strong>Success:</strong> The LED blinks slowly for 2 sec.</td>
</tr>
<tr>
<td></td>
<td><strong>Failure:</strong> The LED blinks rapidly for 2 sec.</td>
</tr>
<tr>
<td>Fault</td>
<td>The LED blinks rapidly if a power fault is detected</td>
</tr>
<tr>
<td>Sleep/Off</td>
<td>The LED is OFF. The on-board debugger is either in a sleep mode or powered down. This can occur if the board is externally powered.</td>
</tr>
</tbody>
</table>

**Info:** Slow blinking is approximately 1 Hz, and rapid blinking is approximately 5 Hz.

3.1.1 **Debugger**

The on-board debugger on the ATtiny1627 Curiosity Nano Board appears as a Human Interface Device (HID) on the host computer’s USB subsystem. The debugger supports full-featured programming and debugging of the ATtiny1627 using Atmel Studio/Microchip MPLAB® X IDE, as well as some third-party IDEs.
Remember: Keep the debugger’s firmware up-to-date. Firmware upgrades are done automatically when using Atmel Studio/Microchip MPLAB® X IDE.

3.1.2 Virtual Serial Port (CDC)
The virtual serial port (CDC) is a general purpose serial bridge between a host PC and a target device.

3.1.2.1 Overview
The on-board debugger implements a composite USB device that includes a standard Communications Device Class (CDC) interface, which appears on the host as a virtual serial port. The CDC can be used to stream arbitrary data in both directions between the host computer and the target: All characters sent through the virtual serial port on the host computer will be transmitted as UART on the debugger’s CDC TX pin, and UART characters captured on the debugger’s CDC RX pin will be returned to the host computer through the virtual serial port.

Figure 3-1. CDC Connection

Info: As shown in Figure 3-1, the debugger’s CDC TX pin is connected to a UART RX pin on the target for receiving characters from the host computer. Similarly, the debugger’s CDC RX pin is connected to a UART TX pin on the target for transmitting characters to the host computer.

3.1.2.2 Operating System Support
On Windows machines, the CDC will enumerate as Curiosity Virtual COM Port and appear in the Ports section of the Windows Device Manager. The COM port number can also be found there.

Info: On older Windows systems, a USB driver is required for CDC. This driver is included in installations of Atmel Studio/Microchip MPLAB® X IDE.

On Linux machines, the CDC will enumerate and appear as /dev/ttyACM#.

Info: tty* devices belong to the “dialout” group in Linux, so it may be necessary to become a member of that group to have permissions to access the CDC.

On MAC machines, the CDC will enumerate and appear as /dev/tty.usbmodem#. Depending on which terminal program is used, it will appear in the available list of modems as usbmodem#.
3.1.2.3 Limitations
Not all UART features are implemented in the on-board debugger CDC. The constraints are outlined here:

- **Baud rate:** Must be in the range of 1200 bps to 500 kbps. Any baud rate outside this range will be set to the closest limit, without warning. Baud rate can be changed on-the-fly.
- **Character format:** Only 8-bit characters are supported.
- **Parity:** Can be odd, even, or none.
- **Hardware flow control:** Not supported.
- **Stop bits:** One or two bits are supported.

3.1.2.4 Signaling
During USB enumeration, the host OS will start both communication and data pipes of the CDC interface. At this point, it is possible to set and read back the baud rate and other UART parameters of the CDC, but data sending and receiving will not be enabled.

When a terminal connects on the host, it must assert the DTR signal. As this is a virtual control signal implemented on the USB interface, it is not physically present on the board. Asserting the DTR signal from the host will indicate to the on-board debugger that a CDC session is active. The debugger will then enable its level shifters (if available), and start the CDC data send and receive mechanisms.

Deasserting DTR in debugger firmware version 1.20 or earlier has the following behaviour:

- Debugger UART receiver is disabled, so no further data will be transferred to the host computer
- Debugger UART transmitter will continue to send data that is queued for sending, but no new data is accepted from the host computer
- Level shifters (if available) are not disabled, so the debugger CDC TX line remains driven.

Deasserting DTR in debugger firmware version 1.21 or later has the following behaviour:

- Debugger UART receiver is disabled, so no further data will be transferred to the host computer
- Debugger UART transmitter will continue to send data that is queued for sending, but no new data is accepted from the host computer
- Once the ongoing transmission is complete, level shifters (if available) are disabled so the debugger CDC TX line will become high-impedence.

**Remember:** Set up the terminal emulator to assert the DTR signal. Without the signal, the on-board debugger will not send or receive any data through its UART.

**Tip:** The on-board debugger’s CDC TX pin will not be driven until the CDC interface is enabled by the host computer. Also, there are no external pull-up resistors on the CDC lines connecting the debugger and the target, which means that during power-up, these lines are floating. To avoid any glitches resulting in unpredictable behavior like framing errors, the target device should enable the internal pull-up resistor on the pin connected to the debugger’s CDC TX pin.
3.1.2.5 Advanced Use

**CDC Override Mode**

In normal operation, the on-board debugger is a true UART bridge between the host and the device. However, in certain use cases, the on-board debugger can override the basic operating mode and use the CDC TX and RX pins for other purposes.

Dropping a text file into the on-board debugger’s mass storage drive can be used to send characters out of the debugger’s CDC TX pin. The filename and extension are trivial, but the text file must start with the characters:

```
CMD:SEND_UART=
```

Debugger firmware version 1.20 or earlier has the following limitations:

- The maximum message length is 50 characters – all remaining data in the frame are ignored.
- The default baud rate used in this mode is 9600 bps, but if the CDC is already active or has been configured, the previously used baud rate still applies.

Debugger firmware version 1.21 and later has the following limitations/features:

- The maximum message length may vary depending on MSC/SCSI layer timeouts on the host computer and/or operating system. A single SCSI frame of 512b (498 characters of payload) is guaranteed, and files of up to 4k will work on most systems. The transfer will complete on the first NULL character encountered in the file.
- The baud rate used is always 9600 bps for the default command

```
CMD:SEND_UART=
```

CDC Override Mode should not be used simultaneously with data transfer over CDC / terminal. If a CDC terminal session is active at the time a file is received via CDC Override Mode, it will be suspended for the duration of the operation and resumed once complete.

- Additional commands are supported with explicit baud rates:

```
CMD:SEND_9600=
CMD:SEND_115200=
CMD:SEND_460800=
```

**USB-Level Framing Considerations**

Sending data from the host to the CDC can be done byte-wise or in blocks, which will be chunked into 64-byte USB frames. Each such frame will be queued up for sending to the debugger’s CDC TX pin. Transferring a small amount of data per frame can be inefficient, particularly at low baud rates, because the on-board debugger buffers frames and not bytes. A maximum of four 64-byte frames can be active at any time. The on-board debugger will throttle the incoming frames accordingly. Sending full 64-byte frames containing data is the most efficient method.

When receiving data on the debugger’s CDC RX pin, the on-board debugger will queue up the incoming bytes into 64-byte frames, which are sent to the USB queue for transmission to the host when they are full. Incomplete frames are also pushed to the USB queue at approximately 100 ms intervals, triggered by USB start-of-frame tokens. Up to eight 64-byte frames can be active at any time.

If the host (or the software running on it) fails to receive data fast enough, an overrun will occur. When this happens, the last-filled buffer frame will be recycled instead of being sent to the USB queue, and a full frame of data will be lost. To prevent this occurrence, the user must ensure that the CDC data pipe is being read continuously, or the incoming data rate must be reduced.

3.1.3 Mass Storage Device

The on-board debugger includes a simple Mass Storage Device implementation, which is accessible for read/write operations via the host operating system to which it is connected.

It provides:

- Read access to basic text and HTML files for detailed kit information and support
• Write access for programming Intel® HEX formatted files into the target device’s memory
• Write access for simple text files for utility purposes

3.1.3.1 Mass Storage Device Implementation

The on-board debugger implements a highly optimized variant of the FAT12 file system that has several limitations, partly due to the nature of FAT12 itself and optimizations made to fulfill its purpose for its embedded application.

The Curiosity Nano USB Device is USB Chapter 9-compliant as a mass storage device but does not, in any way, fulfill the expectations of a general purpose mass storage device. This behavior is intentional.

When using the Windows operating system, the on-board debugger enumerates as a Curiosity Nano USB Device that can be found in the disk drives section of the device manager. The CURIOSITY drive appears in the file manager and claims the next available drive letter in the system.

The CURIOSITY drive contains approximately one MB of free space. This does not reflect the size of the target device’s Flash in any way. When programming an Intel® HEX file, the binary data are encoded in ASCII with metadata providing a large overhead, so one MB is a trivially chosen value for disk size.

It is not possible to format the CURIOSITY drive. When programming a file to the target, the filename may appear in the disk directory listing. This is merely the operating system’s view of the directory, which, in reality, has not been updated. It is not possible to read out the file contents. Removing and replugging the board will return the file system to its original state, but the target will still contain the application that has been previously programmed.

To erase the target device, copy a text file starting with “CMD:ERASE” onto the disk.

By default, the CURIOSITY drive contains several read-only files for generating icons as well as reporting status and linking to further information:

• AUTORUN.ICO – icon file for the Microchip logo
• AUTORUN.INF – system file required for Windows Explorer to show the icon file
• KIT-INFO.HTM – redirect to the development board website
• KIT-INFO.TXT – a text file containing details about the board’s debugger firmware version, board name, USB serial number, device, and drag-and-drop support
• STATUS.TXT – a text file containing the programming status of the board

Info: STATUS.TXT is dynamically updated by the on-board debugger. The contents may be cached by the OS and, therefore, do not reflect the correct status.

3.1.3.2 Fuse Bytes

Fuse Bytes (AVR® MCU Targets)
When doing drag-and-drop programming, the debugger masks out fuse bits that attempt to disable Unified Program and Debug Interface (UPDI). This means that the UPDI pin cannot be used in its reset or GPIO modes; selecting one of the alternative functions on the UPDI pin would render the device inaccessible without using an external debugger capable of high-voltage UPDI activation.

3.1.3.3 Limitations of Drag-and-Drop Programming

Lock Bits
Lock bits included in the hex file will be ignored when using drag-and-drop programming. To program lock bits, use Atmel Studio/Microchip MPLAB® X IDE.

Enabling CRC Check in Fuses
It is not advisable to enable the CRC check in the target device’s fuses when using drag-and-drop programming. This is because a subsequent chip erase (which does not affect fuse bits) will effect a CRC mismatch, and the application will fail to boot. To recover a target from this state, a chip erase must be done using Atmel Studio/Microchip MPLAB® X IDE, which will automatically clear the CRC fuses after erasing.
3.1.3.4 Special Commands
Several utility commands are supported by copying text files to the mass storage disk. The filename or extension is irrelevant – the command handler reacts to content only.

Table 3-2. Special File Commands

<table>
<thead>
<tr>
<th>Command Content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMD:ERASE</td>
<td>Executes a chip erase of the target</td>
</tr>
<tr>
<td>CMD:SEND_UART=</td>
<td>Sends a string of characters to the CDC UART. See “CDC Override Mode”.</td>
</tr>
<tr>
<td>CMD:SEND_9600=CMD:SEND_115200=CMD:SEND_460800=</td>
<td>Sends a string of characters to the CDC UART at the baud rate specified. Note that only the baud rates explicitly specified here are supported! See <em>CDC Override Mode</em> (Debugger firmware v1.21 or newer.)</td>
</tr>
<tr>
<td>CMD:RESET</td>
<td>Resets the target device by entering Programming mode and then exiting Programming mode immediately thereafter. Exact timing can vary according to the programming interface of the target device. (Debugger firmware v1.16 or newer.)</td>
</tr>
<tr>
<td>CMD:POWERTOGGLE</td>
<td>Powers down the target and restores power after a 100 ms delay. If external power is provided, this has no effect. (Debugger firmware v1.16 or newer.)</td>
</tr>
<tr>
<td>CMD:0V</td>
<td>Powers down the target device by disabling the target supply regulator. If external power is provided, this has no effect. (Debugger firmware v1.16 or newer.)</td>
</tr>
<tr>
<td>CMD:1V8</td>
<td>Sets the target voltage to 1.8V. If external power is provided, this has no effect. (Debugger firmware v1.21 or newer.)</td>
</tr>
<tr>
<td>CMD:3V3</td>
<td>Sets the target voltage to 3.3V. If external power is provided, this has no effect. (Debugger firmware v1.16 or newer.)</td>
</tr>
<tr>
<td>CMD:5V0</td>
<td>Sets the target voltage to 5.0V. If external power is provided, this has no effect. (Debugger firmware v1.16 or newer.)</td>
</tr>
</tbody>
</table>

**Info:** The commands listed here are triggered by the content being sent to the mass storage emulated disk, and no feedback is provided in the case of either success or failure.

3.1.4 Data Gateway Interface (DGI)
Data Gateway Interface (DGI) is a USB interface for transporting raw and timestamped data between on-board debuggers and host computer-based visualization tools. MPLAB Data Visualizer is used on the host computer to display debug GPIO data. It is available as a plug-in for MPLAB® X IDE or a stand-alone application that can be used in parallel with Atmel Studio/Microchip MPLAB® X IDE.

Although DGI encompasses several physical data interfaces, the ATtiny1627 Curiosity Nano implementation includes logic analyzer channels:

- Two debug GPIO channels (also known as DGI GPIO)

3.1.4.1 Debug GPIO
Debug GPIO channels are timestamped digital signal lines connecting the target application to a host computer visualization application. They are typically used to plot the occurrence of low-frequency events on a time-axis – for example, when certain application state transitions occur.
The figure below shows the monitoring of the digital state of a mechanical switch connected to a debug GPIO in
MPLAB Data Visualizer.

Figure 3-2. Monitoring Debug GPIO with MPLAB® Data Visualizer

Debug GPIO channels are timestamped, so the resolution of DGI GPIO events is determined by the resolution of the
DGI timestamp module.

**Important:** Although bursts of higher-frequency signals can be captured, the useful frequency range of
signals for which debug GPIO can be used is up to about 2 kHz. Attempting to capture signals above this
frequency will result in data saturation and overflow, which may cause the DGI session to be aborted.

### 3.1.4.2 Timestamping

DGI sources are timestamped as they are captured by the debugger. The timestamp counter implemented in the
Curiosity Nano debugger increments at 2 MHz frequency, providing a timestamp resolution of a half microsecond.

### 3.2 Curiosity Nano Standard Pinout

The 12 edge connections closest to the USB connector on Curiosity Nano boards have a standardized pinout. The
program/debug pins have different functions depending on the target programming interface, as shown in the table
and figure below.

Figure 3-3. Curiosity Nano Standard Pinout

#### 3.3 Power Supply

The board is powered through the USB port and contains two LDO regulators, one to generate 3.3V for the on-board debugger, and an adjustable LDO regulator for the target microcontroller ATtiny1627 and its peripherals. The voltage from the USB connector can vary between 4.4V to 5.25V (according to the USB specification) and will limit the maximum voltage to the target. The figure below shows the entire power supply system on ATtiny1627 Curiosity Nano.

Figure 3-4. Power Supply Block Diagram
3.3.1 Target Regulator

The target voltage regulator is a MIC5353 variable output LDO. The on-board debugger can adjust the voltage output supplied to the board target section by manipulating the MIC5353’s feedback voltage. The hardware implementation is limited to an approximate voltage range from 1.7V to 5.1V. Additional output voltage limits are configured in the debugger firmware to ensure that the output voltage never exceeds the hardware limits of the ATtiny1627 microcontroller. The voltage limits configured in the on-board debugger on ATtiny1627 Curiosity Nano are 1.8-5.1V.

**Info:** The target voltage is set to 3.3V when the board is manufactured. It can be changed through MPLAB X IDE project properties and in the Atmel Studio device programming dialog. Any change to the target voltage is persistent, even through a power toggle. The resolution is less than 5 mV but may be limited to 10 mV by the adjustment program.

**Info:** Voltage settings that are set up in Atmel Studio/Microchip MPLAB® X IDE are not immediately applied to the board. The new voltage setting is applied to the board when the debugger is accessed in any way, like pushing the Refresh Debug Tool Status button in the project dashboard tab, or programming/reading program memory.

**Info:** There is a simple option to adjust the target voltage with a drag and drop command text file to the board. This only supports settings of 0.0V, 3.3V, and 5.0V. See section 3.1.3.4 Special Commands for further details.

The MIC5353 supports a maximum current load of 500 mA. It is an LDO regulator in a small package, placed on a small printed circuit board (PCB), and the thermal shutdown condition can be reached at lower loads than 500 mA. The maximum current load depends on the input voltage, the selected output voltage, and the ambient temperature. The figure below shows the safe operating area for the regulator, with an input voltage of 5.1V and an ambient temperature of 23°C.

**Figure 3-5. Target Regulator Safe Operation Area**

![Target Regulator Safe Operation Area](image)

The voltage output of the target regulator is continuously monitored (measured) by the on-board debugger. If it is more than 100 mV over/under the voltage setting value, an error condition will be flagged, and the target voltage regulator will be turned off. This will detect and handle any short-circuit conditions. It will also detect and handle if an external voltage which causes VCC_TARGET to move outside of the voltage setting monitoring window of ±100 mV is suddenly applied to the VTG pin, without setting the VOFF pin low.
If the external voltage is lower than the monitoring window lower limit (target voltage setting - 100 mV), the on-board debugger status LED will blink rapidly. If the external voltage is higher than the monitoring window upper limit (target voltage setting + 100 mV), the on-board debugger status LED will continue to shine. If the external voltage is removed, the status LED will start to blink rapidly until the on-board debugger detects the new situation and turns the target voltage regulator back on.

### 3.3.2 External Supply

ATtiny1627 Curiosity Nano can be powered by an external voltage instead of the on-board target regulator. When the Voltage Off (VOFF) pin is shorted to ground (GND), the on-board debugger firmware disables the target regulator, and it is safe to apply an external voltage to the VTG pin.

It is also safe to apply an external voltage to the VTG pin when no USB cable is plugged into the DEBUG connector on the board.

The VOFF pin can be tied low/let go at any time. This will be detected by a pin-change interrupt to the on-board debugger, which controls the target voltage regulator accordingly.

**WARNING** Applying an external voltage to the VTG pin without shorting VOFF to GND may cause permanent damage to the board.

**WARNING** Do not apply any voltage to the VOFF pin. Let the pin float to enable the power supply.

**WARNING** Absolute maximum external voltage is 5.5V for the on-board level shifters, and the standard operating condition of the ATtiny1627 is 1.8-5.5V. Applying a higher voltage may cause permanent damage to the board.

**Info:** If an external voltage is applied without pulling the VOFF pin low and an external supply pulls the voltage lower than the monitoring window lower limit (target voltage setting - 100 mV), the on-board debugger status LED will blink rapidly and shut the on-board regulator off. If an external voltage is suddenly removed when the VOFF pin is not pulled low, the status LED will start to blink rapidly, until the on-board debugger detects the new situation and switches the target voltage regulator back on.

Programming, debugging, and data streaming is still possible with an external power supply – the debugger and signal level shifters will be powered from the USB cable. Both regulators, the debugger and the level shifters, are powered down when the USB cable is removed.

**Info:** In addition to the power consumed by the ATtiny1627 and its peripherals, approximately 100 µA will be drawn from any external power source to power the on-board level shifters and voltage monitor circuitry when a USB cable is plugged in the DEBUG connector on the board. When a USB cable is not plugged in, some current is used to supply the level shifters voltage pins, which have a worst-case current consumption of approximately 5 µA. Typical values may be as low as 100 nA.

### 3.3.3 VBUS Output Pin

ATtiny1627 Curiosity Nano has a VBUS output pin that can be used to power external components that need a 5V supply. The VBUS output pin has a PTC fuse to protect the USB against short circuits. A side effect of the PTC fuse is a voltage drop on the VBUS output with higher current loads. The chart below shows the voltage versus the current load of the VBUS output.
3.3.4 Power Supply Exceptions

This is a summary of most exceptions that can occur with the power supply.

**Target Voltage Shuts Down**
This can happen if the target section draws too much current at a given voltage. This will cause the thermal shutdown safety feature of the MIC5353 regulator to kick in. To avoid this, reduce the current load of the target section.

**Target Voltage Setting is Not Reached**
The maximum output voltage is limited by the USB input voltage (specified to be 4.4V-5.25V), and the voltage drop over the MIC5353 regulator at a given voltage setting and current consumption. If a higher output voltage is needed, use a USB power source that can provide a higher input voltage or use an external voltage supply on the VTG pin.

**Target Voltage is Different From Setting**
This can be caused by an externally applied voltage to the VTG pin, without setting the VOFF pin low. If the target voltage differs more than 100 mV over/under the voltage setting, it will be detected by the on-board debugger, and the internal voltage regulator will be shut down. To fix this issue, remove the applied voltage from the VTG pin, and the on-board debugger will enable the on-board voltage regulator when the new condition is detected. Note that the PS LED will be blinking rapidly if the target voltage is below 100 mV of the setting, but will be lit normally when it is higher than 100 mV above the setting.

**No, Or Very Low Target Voltage, and PS LED is Blinking Rapidly**
This can be caused by a full or partial short-circuit and is a special case of the issue mentioned above. Remove the short-circuit, and the on-board debugger will re-enable the on-board target voltage regulator.

**No Target Voltage and PS LED is Lit 1**
This occurs if the target voltage is set to 0.0V. To fix this, set the target voltage to a value within the specified voltage range for the target device.

**No Target Voltage and PS LED is Lit 2**
This can be the issue if power jumper J100 and/or J101 is cut, and the target voltage regulator is set to a value within the specified voltage range for the target device. To fix this, solder a wire/bridge between the pads for J100/J101, or add a jumper on J101 if a pin header is mounted.

**VBUS Output Voltage is Low or Not Present**
This is most lightly caused by a high-current drain on VBUS, and the protection fuse (PTC) will reduce the current or cut off completely. Reduce the current consumption on the VBUS pin to fix this issue.
3.4 Low Power Measurement

Power to the ATtiny1627 is connected from the on-board power supply and V TG pin through a 100 mil pin header marked with “POWER” in silkscreen (J101). To measure the power consumption of the ATtiny1627 and other peripherals connected to the board, cut the Target Power strap and connect an ammeter over the strap.

To measure the lowest possible power consumption follow these steps:

1. Cut the POWER strap with a sharp tool.
2. Solder a 1x2 100 mil pin header in the footprint.
3. Connect an ammeter to the pin header.
4. Write firmware that.
   4.1. Tri-states any I/O connected to the on-board debugger.
   4.2. Sets the microcontroller in its lowest power Sleep state.
5. Program the firmware into the ATtiny1627.

Figure 3-7. Target Power Strap

Tip: A 100-mil pin header can be soldered into the Target Power strap (J101) footprint for easy connection of an ammeter. Once the ammeter is no longer needed, place a jumper cap on the pin header.

Info: The on-board level shifters will draw a small amount of current even when they are not in use. A maximum of 2 µA can be drawn from each I/O pin connected to a level shifter for a total of 10 µA. Keep any I/O pin connected to a level shifter in tri-state to prevent leakage. All I/Os connected to the on-board debugger are listed in 4.2.4.1 On-Board Debugger Connections. To prevent any leakage to the on-board level shifters, they can be disconnected completely, as described in 7.4 Disconnecting the On-board Debugger.
3.5 Programming External Microcontrollers

The on-board debugger on ATtiny1627 Curiosity Nano can be used to program and debug microcontrollers on external hardware.

3.5.1 Supported Devices

All external AVR microcontrollers with the UPDI interface can be programmed and debugged with the on-board debugger with Atmel Studio.

External SAM microcontrollers that have a Curiosity Nano Board can be programmed and debugged with the on-board debugger with Atmel Studio.

ATtiny1627 Curiosity Nano can program and debug external ATtiny1627 microcontrollers with MPLAB X IDE.

3.5.2 Software Configuration

No software configuration is required to program and debug the same device that is mounted on the board.

To program and debug a different microcontroller than what is mounted on the board, Atmel Studio must be configured to allow free selection of devices and programming interfaces.

1. Navigate to Tools > Options through the menu system at the top of the application.
2. Select the Tools > Tool settings category in the options window.
3. Set the Hide unsupported devices option to False.

Figure 3-8. Hide Unsupported Devices

Info: Atmel Studio allows any microcontroller and interface to be selected when Hide unsupported devices is set to False, also microcontrollers and interfaces which are not supported by the on-board debugger.
3.5.3 Hardware Modifications

The on-board debugger is connected to the ATtiny1627 by default. These connections must be removed before any external microcontroller can be programmed or debugged. Cut the GPIO straps shown in the figure below with a sharp tool to disconnect the ATtiny1627 from the on-board debugger.

Figure 3-9. Programming and Debugging Connections to Debugger

![GPIO straps (bottom side)](image)

*Info:* Cutting the connections to the debugger will disable programming, debugging, and data streaming from the ATtiny1627 mounted on the board.

*Tip:* Solder in 0Ω resistors across the footprints or short-circuit them with solder to reconnect the signals between the on-board debugger and the ATtiny1627.

3.5.4 Connecting to External Microcontrollers

The figure and table below show where the programming and debugging signals must be connected to program and debug external microcontrollers. The on-board debugger can supply power to the external hardware, or use an external voltage as a reference for its level shifters. Read more about the power supply in 3.3 Power Supply.

The on-board debugger and level shifters actively drive data and clock signals (DBG0, DBG1, and DBG2) used for programming and debugging, and in most cases, the external resistor on these signals can be ignored. Pull-down resistors are required on the ICSP™ data and clock signals to debug PIC® microcontrollers.

DBG3 is an open-drain connection and requires a pull-up resistor to function.

*Remember:*
- Connect GND and VTG to the external microcontroller
- Tie the VOFF pin to GND if the external hardware has its own power supply
- Make sure there are pull-down resistors on the ICSP data and clock signals (DBG0 and DBG1) to support the debugging of PIC microcontrollers
3.6 Connecting External Debuggers

Even though there is an on-board debugger, external debuggers can be connected directly to the ATtiny1627 Curiosity Nano to program/debug the ATtiny1627. The on-board debugger keeps all the pins connected to the ATtiny1627 and board edge in tri-state when not actively used. Therefore, the on-board debugger will not interfere with any external debug tools.

To avoid contention between the external debugger and the on-board debugger, do not start any programming/debug operation with the on-board debugger through Atmel Studio/Microchip MPLAB® X IDE or mass storage programming while the external tool is active.
4. Hardware User Guide

4.1 Connectors

4.1.1 ATtiny1627 Curiosity Nano Pinout
All the ATtiny1627 I/O pins are accessible at the edge connectors on the board. The image below shows the board pinout. For all available functions on each pin, refer to the I/O Multiplexing and Considerations section in the ATtiny1627 data sheet.

Figure 4-1. ATtiny1627 Curiosity Nano Pinout

4.1.2 Using Pin Headers
The edge connector footprint on ATtiny1627 Curiosity Nano has a staggered design where each hole is shifted 8 mil (~0.2 mm) off-center. The hole shift allows the use of regular 100 mil pin headers on the board without soldering. Once the pin headers are firmly in place, they can be used in normal applications like pin sockets and prototyping boards without any issues.

Tip: Start at one end of the pin header and gradually insert the header along the length of the board. Once all the pins are in place, use a flat surface to push them in.

Tip: For applications where the pin headers will be used permanently, it is still recommended to solder them in place.
4.2 Peripherals

4.2.1 LED
There is one yellow user LED available on the ATtiny1627 Curiosity Nano Board that can be controlled by either GPIO or PWM. The LED can be activated by driving the connected I/O line to GND.

Table 4-1. LED Connection

</tbody>
</table>

4.2.2 Mechanical Switch
The ATtiny1627 Curiosity Nano has one mechanical switch. This is a generic user-configurable switch. When the switch is pressed, it will drive the I/O line to ground (GND).

Tip: There is no externally connected pull-up resistor on the switch. To use the switch, make sure that an internal pull-up resistor is enabled on pin PC4.

4.2.3 Crystal
The ATtiny1627 Curiosity Nano Board has a 32.768 kHz crystal footprint made for standard 3.2mm by 1.5mm surface mount crystals with two terminals.

The crystal footprint is not connected to the ATtiny1627 by default, as the GPIOs are routed out to the edge connector. To use the crystal, some hardware modifications are required. The two I/O lines routed to the edge connector must be disconnected to reduce the chance of contention to the crystal, and to remove excessive capacitance on the lines. This can be done by cutting the two straps on the bottom side of the board, marked PB2 and PB3 as shown in the figure below. Next, short circuit each of the circular solder points next to the crystal on the top side of the board, the easiest way is to solder a solder tin blob across the footprint.
A crystal with 7pF equivalent load capacitance and 70kΩ ESR (XC200) and two 4.7pF external matching capacitors for C203 and C204 have been tested to yield good results on this board. See the 7.2 Assembly Drawing for footprint locations.

### 4.2.4 On-Board Debugger Implementation

ATtiny1627 Curiosity Nano features an on-board debugger that can be used to program and debug the ATtiny1627 using UPDI. The on-board debugger also includes a virtual serial port (CDC) interface over UART and debug GPIO. Atmel Studio/Microchip MPLAB® X IDE can be used as a front-end for the on-board debugger for programming and debugging. MPLAB Data Visualizer can be used as a front-end for the CDC and debug GPIO.

### 4.2.4.1 On-Board Debugger Connections

The table below shows the connections between the target and the debugger section. All connections between the target and the debugger are tri-stated as long as the debugger is not actively using the interface. Hence, since there are little contaminations of the signals, the pins can be configured to anything the user wants.

For further information on how to use the capabilities of the on-board debugger, see 3.1 On-Board Debugger Overview.

5. **Hardware Revision History and Known Issues**

This user guide is written to provide information about the latest available revision of the board. The following sections contain information about known issues, a revision history of older revisions, and how older revisions differ from the latest revision.

5.1 **Identifying Product ID and Revision**

The revision and product identifier of the ATtiny1627 Curiosity Nano Board can be found in two ways: Either by utilizing the Atmel Studio/Microchip MPLAB® X IDE Kit Window or by looking at the sticker on the bottom side of the PCB.

By connecting ATtiny1627 Curiosity Nano to a computer with Atmel Studio/Microchip MPLAB® X IDE running, the Kit Window will pop up. The first six digits of the serial number, which is listed under kit information, contain the product identifier and revision.

**Tip:** The Kit Window can be opened in MPLAB® X IDE through the menu bar Window > Kit Window.

The same information can be found on the sticker on the bottom side of the PCB. Most boards will have the identifier and revision printed in plain text as A09-nnnn\rr, where “nnnn” is the identifier, and “rr” is the revision. Boards with limited space have a sticker with only a data matrix code, containing the product identifier, revision, and serial number.

The serial number string has the following format:

```
"nnnnrrssssssssss"
```

- **n** = product identifier
- **r** = revision
- **s** = serial number

The product identifier for ATtiny1627 Curiosity Nano is A09-3258.

5.2 **Revision 3**

Revision 3 is the same as revision 2, but is mounted with production samples of ATtiny1627.

5.3 **Revision 2**

Revision 2 is the initial prototype revision, with a limited distribution. This revision is mounted with engineering samples of ATtiny1627.

7.4 Disconnecting the On-board Debugger

The on-board debugger and level shifters can be completely disconnected from the ATtiny1627.

The block diagram below shows all connections between the debugger and the ATtiny1627. The rounded boxes represent connections to the board edge. The signal names shown are also printed in silkscreen on the bottom side of the board.

To disconnect the debugger, cut the straps shown in Figure 7-6.

Attention: Cutting the GPIO straps to the on-board debugger will disable the virtual serial port, programming, debugging, and data streaming. Cutting the power supply strap will disconnect the on-board power supply.

Tip: Any connection that is cut can be reconnected using solder. Alternatively, a 0Ω 0402 resistor can be mounted.

Tip: When the debugger is disconnected, an external debugger can be connected to holes shown in Figure 7-6. Details about connecting an external debugger are described in 3.6 Connecting External Debuggers.

Figure 7-5. On-Board Debugger Connections Block Diagram
7.5 Getting Started with IAR

IAR Embedded Workbench® for AVR® is a proprietary high-efficiency compiler not based on GCC. Programming and debugging of ATtiny1627 Curiosity Nano is supported in IAR™ Embedded Workbench for AVR using the Atmel-ICE interface. Some initial settings must be set up in the project to get the programming and debugging to work.

The following steps will explain how to get your project ready for programming and debugging:

1. Make sure you have opened the project you want to configure. Open the OPTIONS dialog for the project.
2. In the category General Options, select the Target tab. Select the device for the project, or if not listed, the core of the device, as shown in Figure 7-7.
3. In the category Debugger, select the Setup tab. Select Atmel-ICE as the driver, as shown in Figure 7-8.
4. In the category Debugger > Atmel-ICE, select the Atmel-ICE 1 tab. Select UPDI as the interface and, optionally, select the UPDI frequency, as shown in Figure 7-9.

Info: If the selection of Debug Port (mentioned in step 4) is grayed out, the interface is preselected, and the user can skip this configuration step.

The Microchip Website

Microchip provides online support via our website at www.microchip.com/. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user’s guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip’s product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to www.microchip.com/pcn and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: www.microchip.com/support

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
