ATF16V8B, ATF16V8BQ*, and ATF16V8BQL

High-performance EE PLD

DATASHEET

Features

- Industry-standard Architecture
  - Emulates Many 20-pin PALs®
  - Low-cost Easy-to-use Software Tools
- High-speed Electrically-erasable Programmable Logic Devices
  - 10ns Maximum Pin-to-pin Delay
- Automatic 5mA Standby for ATF16V8BQL
- CMOS and TTL Compatible Inputs and Outputs
  - Input and I/O Pull-up Resistors
- Advanced Flash Technology
  - Reprogrammable
  - 100% Tested
- High-reliability CMOS Process
  - 20 Year Data Retention
  - 100 Erase/Write Cycles
  - 2,000V ESD Protection
  - 200mA Latchup Immunity
- Industrial Temperature Range
- Dual-in-line and Surface Mount Packages in Standard Pinouts
- PCI-compliant
- Green Package Options (Pb/Halide-free/RoHS Compliant)

Description

The Atmel® ATF16V8B(QL) is a high-performance CMOS Electrically-Erasable Programmable Logic Device (EE PLD) that utilizes the Atmel proven electrically-erasable Flash memory technology. All speed ranges are specified over the full 5.0V ± 10% range for industrial temperature range.

The ATF16V8BQL provides edge-sensing low-power PLD solution with low standby power consumption (5mA typical). The ATF16V8BQL powers down automatically to the low-power mode through the Input Transition Detection (ITD) circuitry when the device is idle.

The ATF16V8B(QL) incorporate a super set of the generic architectures, which allows direct replacement of the 16R8 family and most 20-pin combinatorial PLDs. Eight outputs are each allocated eight product terms. Three different modes of operation, configured automatically with software, allow highly complex logic functions to be realized.

*The ATF16V8BQ is Replaced by ATF16V8B and ATF16V8BQL

*Notice: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V DC, which may undershoot to -2.0V for pulses of less than 20ns. Maximum output pin voltage is \( V_{CC} + 0.75V \) DC, which may overshoot to 7.0V for pulses of less than 20ns.

$C_L$ includes Test fixture and Probe capacitance

3.7 **Power-up Reset**

The registers in the ATF16V8B(QL) are designed to reset during power-up. At a point delayed slightly from $V_{CC}$ crossing $V_{RST}$, all registers will be reset to the low state. As a result, the registered output state will always be high on power-up.

This feature is critical for state machine initialization. However, due to the asynchronous nature of reset and the uncertainty of how $V_{CC}$ actually rises in the system, the following conditions are required:

1. The $V_{CC}$ rise must be monotonic,
2. After reset occurs, all input and feedback setup times must be met before driving the clock pin high, and
3. The clock must remain stable during $t_{PR}$.

Figure 3-4. Power-up Reset Waveforms

Power

Registered Outputs

Clock
3.8 Preload of Registered Outputs

The ATF16V8B(QL) device registers are provided with circuitry to allow loading of each register with either a high or a low. This feature will simplify testing since any state can be forced into the registers to control test sequencing. A JEDEC file with preload is generated when a source file with vectors is compiled. Once downloaded, the JEDEC file preload sequence will be done automatically by most of the approved programmers after the programming.

4. Security Fuse Usage

A single fuse is provided to prevent unauthorized copying of the ATF16V8B(QL) fuse patterns. Once programmed, fuse verify and preload are inhibited. However, the 64-bit User Signature remains accessible. The security fuse should be programmed last, as its effect is immediate.

5. Electronic Signature Word

There are 64 bits of programmable memory that are always available to the user, even if the device is secured. These bits can be used for user-specific data.

6. Programming/Erasing

Programming/erasing is performed using standard PLD programmers.

7. Input and I/O Pull-ups

All ATF16V8B(QL) family members have internal input and I/O pull-up resistors. Therefore, whenever inputs or I/Os are not being driven externally, they will float to VCC. This ensures that all logic array inputs are at known states. These are relatively weak active pull-ups that can easily be over driven by TTL-compatible drivers (see input and I/O diagrams below).

![Input Diagram](Diagram)
8. Functional Logic Diagram Description

The logic option and functional diagrams describe the ATF16V8B(QL) architecture. Eight configurable
macrocells can be configured as a registered output, combinatorial I/O, combinatorial output, or dedicated input.
The ATF16V8B(QL) can be configured in one of three different modes. Each mode makes the ATF16V8B(QL)
look like a different device. Most PLD compilers can choose the right mode automatically. The user can also
force the selection by supplying the compiler with a mode selection. The determining factors would be the usage
of register versus combinatorial outputs and dedicated outputs versus outputs with output enable control.
The ATF16V8B(QL) universal architecture can be programmed to emulate many 20-pin PAL devices. These
architectural subsets can be found in each of the configuration modes described in the following pages. The
user can download the listed subset device JEDEC programming file to the PLD programmer, and the
ATF16V8B(QL) can be configured to act like the chosen device. Check with your programmer manufacturer for
this capability.
Unused product terms are automatically disabled by the compiler to decrease power consumption. A security
fuse, when programmed, protects the content of the ATF16V8B(QL). Eight bytes (64 fuses) of User Signature
are accessible to the user for purposes such as storing project name, part number, revision, or date. The User
Signature is accessible regardless of the state of the security fuse.

9. Software Support

Atmel WinCUPL is a free tool, available on Atmel’s web site and can be used to design in all members of the
ATF16V8B(QL) family of SPLDs. The below table lists the Atmel WinCUPL device mnemonics for the different
macrocell configuration modes.

| Table 9-1. Compiler Mode Selection |
|-------------------|------------------|-----------------|-----------------|------------------|
|                  | Registered       | Complex         | Simple          | Auto Select      |
| CUPL, Atmel WinCUPL | G16V8MS        | G16V8MA         | G16V8AS         | G16V8            |
10. Macrocell Configuration

Software compilers support the three different OMC modes as different device types. Most compilers have the ability to automatically select the device type, generally based on the register usage and Output Enable (OE) usage. Register usage on the device forces the software to choose the registered mode. All combinatorial outputs with OE controlled by the product term will force the software to choose the complex mode. The software will choose the simple mode only when all outputs are dedicated combinatorial without OE control. The different device types can be used to override the automatic device selection by the software. For further details, refer to the compiler software manuals.

When using compiler software to configure the device, the user must pay special attention to the following restrictions in each mode:

- **Registered Mode**
  Pin 1 and pin 11 are permanently configured as clock and output enable respectively. These pins cannot be configured as dedicated inputs in the registered mode.

- **Complex Mode**
  Pin 1 and pin 11 become dedicated inputs and use the feedback paths of pin 19 and pin 12 respectively. Because of this feedback path usage, pin 19 and pin 12 do not have the feedback option in this mode.

- **Simple Mode**
  All feedback paths of the output pins are routed via the adjacent pins. In doing so, the two inner most pins (pins 15 and 16) will not have the feedback option as these pins are always configured as dedicated combinatorial output.

10.1 ATF16V8B(QL) Registered Mode

**PAL Device Emulation/PAL Replacement.** The registered mode is used if one or more registers are required. Each macrocell can be configured as either a registered or combinatorial output or I/O, or as an input. For a registered output or I/O, the output is enabled by the OE pin, and the register is clocked by the CLK pin. Eight product terms are allocated to the sum term. For a combinatorial output or I/O, the output enable is controlled by a product term, and seven product terms are allocated to the sum term. When the macrocell is configured as an input, the output enable is permanently disabled.

Any register usage will make the compiler select this mode. The following registered devices can be emulated using this mode:

- 16R8
- 16R6
- 16R4
- 16RP8
- 16RP6
- 16RP4
Figure 10-1. Registered Configuration for Registered Mode\(^{(1)(2)}\)

Notes:
1. Pin 1 controls common CLK for the registered outputs. Pin 11 controls common OE for the registered outputs. Pin 1 and Pin 11 are permanently configured as CLK and OE.
2. The development software configures all the architecture control bits and checks for proper pin usage automatically.

Figure 10-2. Combinatorial Configuration for Registered Mode\(^{(1)(2)}\)

Notes:
1. Pin 1 and Pin 11 are permanently configured as CLK and OE.
2. The development software configures all the architecture control bits and checks for proper pin usage automatically.
Figure 10-3. Registered Mode Logic Diagram
10.2 ATF16V8B(QL) Complex Mode

**PAL Device Emulation/PAL Replacement.** In the complex mode, combinatorial output and I/O functions are possible. Pins 1 and 11 are regular inputs to the array. Pins 13 through 18 have pin feedback paths back to the AND-array, which makes full I/O capability possible. Pins 12 and 19 (outermost macrocells) are outputs only. They do not have input capability. In this mode, each macrocell has seven product terms going to the sum term and one product term enabling the output.

Combinatorial applications with an OE requirement will make the compiler select this mode. The following devices can be emulated using this mode:

- 16L8
- 16H8
- 16P8

**Figure 10-4. Complex Mode Option**

Pins 12 and 19 do not have this feedback path.
Figure 10-5. Complex Mode Logic Diagram
10.3 ATF16V8B(QL) Simple Mode

PAL Device Emulation/PAL Replacement. In the Simple Mode, 8 product terms are allocated to the sum term. Pins 15 and 16 (center macrocells) are permanently configured as combinatorial outputs. Other macrocells can be either inputs or combinatorial outputs with pin feedback to the AND-array. Pins 1 and 11 are regular inputs. The compiler selects this mode when all outputs are combinatorial without OE control. The following simple PALs can be emulated using this mode:

- 10L8
- 12L6
- 14L4
- 16L2
- 10H8
- 12H6
- 14H4
- 16H2
- 10P8
- 12P6
- 14P4
- 16P2

Figure 10-6. Simple Mode Option

* Pins 15 and 16 are always enabled.

Pins 15 and 16 do not have this feedback path.

</table>
13. Packaging Information

13.1 20S2 — 20-lead SOIC

Notes:
1. This drawing is for general information only. Refer to JEDEC Drawing MS-013, Variation AC, for proper dimensions, tolerances, datums, etc.
2. Dimension D does not include mold flash, protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.15 mm per end. Dimension E1 does not include interlead flash or protrusion. Interlead flash or protrusion shall not exceed 0.25 mm per side.
3. The package top may be smaller than the package bottom. Dimensions D and E1 are determined at the outermost extremes of the plastic body exclusive of mold flash, the bar burrs, gate burrs and interlead flash, but including any mismatch between the top and bottom of the plastic body.
4. The dimensions apply to the flat section of the lead between 0.10 to 0.25 mm from the lead tip.
5. Dimension ‘b’ does not include the dambar protrusion. Allowable dambar protrusion shall be 0.10 mm total in excess of the ‘b’ dimension at maximum material condition. The dambar may not be located on the lower radius of the foot.
6. ‘A1’ is defined as the vertical distance from the seating plane to the lowest point on the package body excluding the lid or thermal enhancement on the cavity down package configuration.

7/1/14
13.2 20X — 20-lead TSSOP

Notes:
1. This drawing is for general information only. Please refer to JEDEC Drawing MO-153, Variation AC, for additional information.
2. Dimension D does not include mold Flash, protrusions or gate burrs. Mold Flash, protrusions and gate burrs shall not exceed 0.15 mm (0.006 in) per side.
3. Dimension E1 does not include inter-lead Flash or protrusions. Inter-lead Flash and protrusions shall not exceed 0.25 mm (0.010 in) per side.
4. Dimension b does not include Dambar protrusion. Allowable Dambar protrusion shall be 0.08 mm total in excess of the b dimension at maximum material condition. Dambar cannot be located on the lower radius of the foot. Minimum space between protrusion and adjacent lead is 0.07 mm.
5. Dimension D and E1 to be determined at Datum Plane H.
13.3 20P3 — 20-lead PDIP

Notes:
1. This package conforms to JEDEC reference MS-001, Variation AD.
2. Dimensions D and E1 do not include mold Flash or Protrusion. Mold Flash or Protrusion shall not exceed 0.25 mm (0.010").
13.4 20J — 20-lead PLCC

Notes:
1. This package conforms to JEDEC reference MS-018, Variation AA.
2. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.10" (0.254mm) per side. Dimension D1 and E1 include mold mismatch and are measured at the extreme material condition at the upper or lower parting line.
3. Lead coplanarity is 0.004" (0.102mm) maximum
