SMART ARM-based Microcontrollers

AT03264: SAM D/R/L/C Watchdog (WDT) Driver

APPLICATION NOTE

Introduction

This driver for Atmel® | SMART ARM®-based microcontrollers provides an interface for the configuration and management of the device's Watchdog Timer module, including the enabling, disabling, and kicking within the device. The following driver API modes are covered by this manual:

- Polled APIs
- Callback APIs

The following peripherals are used by this module:

- WDT (Watchdog Timer)

The following devices can use this module:

- Atmel | SMART SAM D20/D21
- Atmel | SMART SAM R21
- Atmel | SMART SAM D09/D10/D11
- Atmel | SMART SAM L21/L22
- Atmel | SMART SAM DA1
- Atmel | SMART SAM C20/C21

The outline of this documentation is as follows:

- Prerequisites
- Module Overview
- Special Considerations
- Extra Information
- Examples
- API Overview

2. **Prerequisites**

There are no prerequisites for this module.
3. Module Overview

The Watchdog module (WDT) is designed to give an added level of safety in critical systems, to ensure a system reset is triggered in the case of a deadlock or other software malfunction that prevents normal device operation.

At a basic level, the Watchdog is a system timer with a fixed period; once enabled, it will continue to count ticks of its asynchronous clock until it is periodically reset, or the timeout period is reached. In the event of a Watchdog timeout, the module will trigger a system reset identical to a pulse of the device's reset pin, resetting all peripherals to their power-on default states and restarting the application software from the reset vector.

In many systems, there is an obvious upper bound to the amount of time each iteration of the main application loop can be expected to run, before a malfunction can be assumed (either due to a deadlock waiting on hardware or software, or due to other means). When the Watchdog is configured with a timeout period equal to this upper bound, a malfunction in the system will force a full system reset to allow for a graceful recovery.

3.1. Locked Mode

The Watchdog configuration can be set in the device fuses and locked in hardware, so that no software changes can be made to the Watchdog configuration. Additionally, the Watchdog can be locked on in software if it is not already locked, so that the module configuration cannot be modified until a power on reset of the device.

The locked configuration can be used to ensure that faulty software does not cause the Watchdog configuration to be changed, preserving the level of safety given by the module.

3.2. Window Mode

Just as there is a reasonable upper bound to the time the main program loop should take for each iteration, there is also in many applications a lower bound, i.e. a minimum time for which each loop iteration should run for under normal circumstances. To guard against a system failure resetting the Watchdog in a tight loop (or a failure in the system application causing the main loop to run faster than expected) a "Window" mode can be enabled to disallow resetting of the Watchdog counter before a certain period of time. If the Watchdog is not reset after the window opens but not before the Watchdog expires, the system will reset.

3.3. Early Warning

In some cases it is desirable to receive an early warning that the Watchdog is about to expire, so that some system action (such as saving any system configuration data for failure analysis purposes) can be performed before the system reset occurs. The Early Warning feature of the Watchdog module allows such a notification to be requested; after the configured early warning time (but before the expiry of the Watchdog counter) the Early Warning flag will become set, so that the user application can take an appropriate action.

Note: It is important to note that the purpose of the Early Warning feature is not to allow the user application to reset the Watchdog; doing so will defeat the safety the module gives to the user application.
Instead, this feature should be used purely to perform any tasks that need to be undertaken before the system reset occurs.

3.4. **Physical Connection**

*Figure 3-1 Physical Connection* on page 7 shows how this module is interconnected within the device.

*Figure 3-1. Physical Connection*

![Diagram showing Physical Connection]

**Note:** Watchdog Counter of SAM L21/L22 is *not* provided by GCLK, but it uses an internal 1KHz OSCULP32K output clock.
4. **Special Considerations**

On some devices the Watchdog configuration can be fused to be always on in a particular configuration; if this mode is enabled the Watchdog is not software configurable and can have its count reset and early warning state checked/cleared only.
5. Extra Information

For extra information, see Extra Information for WDT Driver. This includes:

- Acronyms
- Dependencies
- Errata
- Module History
6. **Examples**

For a list of examples related to this driver, see *Examples for WDT Driver.*
7. API Overview

7.1. Variable and Type Definitions

7.1.1. Callback Configuration and Initialization

7.1.1.1. Type wdt_callback_t

```c
typedef void(* wdt_callback_t )(void)
```

Type definition for a WDT module callback function.

7.2. Structure Definitions

7.2.1. Struct wdt_conf

Configuration structure for a Watchdog Timer instance. This structure should be initialized by the `wdt_get_config_defaults()` function before being modified by the user application.

7.3. Function Definitions

7.3.1. Configuration and Initialization

7.3.1.1. Function wdt_is_syncing()

Determines if the hardware module(s) are currently synchronizing to the bus.

```c
bool wdt_is_syncing( void )
```
Checks to see if the underlying hardware peripheral module(s) are currently synchronizing across multiple clock domains to the hardware bus. This function can be used to delay further operations on a module until such time that it is ready, to prevent blocking delays for synchronization in the user application.

**Returns**
Synchronization status of the underlying hardware module(s).

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>If the module has completed synchronization</td>
</tr>
<tr>
<td>true</td>
<td>If the module synchronization is ongoing</td>
</tr>
</tbody>
</table>

### 7.3.1.2. Function `wdt_get_config_defaults()`

Initializes a Watchdog Timer configuration structure to defaults.

```c
void wdt_get_config_defaults(
    struct wdt_conf *const config)
```

Initializes a given Watchdog Timer configuration structure to a set of known default values. This function should be called on all new instances of these configuration structures before being modified by the user application.

The default configuration is as follows:
- Not locked, to allow for further (re-)configuration
- Enable WDT
- Watchdog timer sourced from Generic Clock Channel 4
- A timeout period of 16384 clocks of the Watchdog module clock
- No window period, so that the Watchdog count can be reset at any time
- No early warning period to indicate the Watchdog will soon expire

<tr>
<th>Data direction</th>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[out]</td>
<td>config</td>
<td>Configuration structure to initialize to default values</td>
</tr>
</tbody>
</table>

### 7.3.1.3. Function `wdt_set_config()`

Sets up the WDT hardware module based on the configuration.

```c
enum status_code wdt_set_config(
    const struct wdt_conf *const config)
```

Writes a given configuration of a WDT configuration to the hardware module, and initializes the internal device struct.

<table>
<thead>
<tr>
<th>Data direction</th>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in]</td>
<td>config</td>
<td>Pointer to the configuration struct</td>
</tr>
</tbody>
</table>
Returns
Status of the configuration procedure.

Table 7-5. Return Values

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_OK</td>
<td>If the module was configured correctly</td>
</tr>
<tr>
<td>STATUS_ERR_INVALID_ARG</td>
<td>If invalid argument(s) were supplied</td>
</tr>
<tr>
<td>STATUS_ERR_IO</td>
<td>If the Watchdog module is locked to be always on</td>
</tr>
</tbody>
</table>

7.3.1.4. Function wdt_is_locked()

Determines if the Watchdog timer is currently locked in an enabled state.

```c
bool wdt_is_locked( void )
```

Determines if the Watchdog timer is currently enabled and locked, so that it cannot be disabled or otherwise reconfigured.

**Returns**
Current Watchdog lock state.

7.3.2. Timeout and Early Warning Management

7.3.2.1. Function wdt_clear_early_warning()

Clears the Watchdog timer early warning period elapsed flag.

```c
void wdt_clear_early_warning( void )
```

Clears the Watchdog timer early warning period elapsed flag, so that a new early warning period can be detected.

7.3.2.2. Function wdt_is_early_warning()

Determines if the Watchdog timer early warning period has elapsed.

```c
bool wdt_is_early_warning( void )
```

Determines if the Watchdog timer early warning period has elapsed.

**Note:** If no early warning period was configured, the value returned by this function is invalid.

**Returns**
Current Watchdog Early Warning state.

7.3.2.3. Function wdt_reset_count()

Resets the count of the running Watchdog Timer that was previously enabled.

```c
void wdt_reset_count( void )
```

Resets the current count of the Watchdog Timer, restarting the timeout period count elapsed. This function should be called after the window period (if one was set in the module configuration) but before the timeout period to prevent a reset of the system.
7.3.3. Callback Configuration and Initialization

7.3.3.1. Function wdt_register_callback()

Registers an asynchronous callback function with the driver.

```c
enum status_code wdt_register_callback(
    const wdt_callback_t callback,
    const enum wdt_callback type)
```

Registers an asynchronous callback with the WDT driver, fired when a given criteria (such as an Early Warning) is met. Callbacks are fired once for each event.

Table 7-6. Parameters

<table>
<thead>
<tr>
<th>Data direction</th>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in]</td>
<td>callback</td>
<td>Pointer to the callback function to register</td>
</tr>
<tr>
<td>[in]</td>
<td>type</td>
<td>Type of callback function to register</td>
</tr>
</tbody>
</table>

Returns

Status of the registration operation.

Table 7-7. Return Values

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_OK</td>
<td>The callback was registered successfully</td>
</tr>
<tr>
<td>STATUS_ERR_INVALID_ARG</td>
<td>If an invalid callback type was supplied</td>
</tr>
</tbody>
</table>

7.3.3.2. Function wdt_unregister_callback()

Unregisters an asynchronous callback function with the driver.

```c
enum status_code wdt_unregister_callback(
    const enum wdt_callback type)
```

Unregisters an asynchronous callback with the WDT driver, removing it from the internal callback registration table.

Table 7-8. Parameters

<table>
<thead>
<tr>
<th>Data direction</th>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in]</td>
<td>type</td>
<td>Type of callback function to unregister</td>
</tr>
</tbody>
</table>

Returns

Status of the de-registration operation.

Table 7-9. Return Values

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_OK</td>
<td>The callback was Unregistered successfully</td>
</tr>
<tr>
<td>STATUS_ERR_INVALID_ARG</td>
<td>If an invalid callback type was supplied</td>
</tr>
</tbody>
</table>
7.3.4. Callback Enabling and Disabling

7.3.4.1. Function `wdt_enable_callback()`

Enables asynchronous callback generation for a given type.

```c
enum status_code wdt_enable_callback(
    const enum wdt_callback type)
```

Enables asynchronous callbacks for a given callback type. This must be called before an external interrupt channel will generate callback events.

Table 7-10. Parameters

<table>
<thead>
<tr>
<th>Data direction</th>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in]</td>
<td>type</td>
<td>Type of callback function to enable</td>
</tr>
</tbody>
</table>

Returns

Status of the callback enable operation.

Table 7-11. Return Values

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_OK</td>
<td>The callback was enabled successfully</td>
</tr>
<tr>
<td>STATUS_ERR_INVALID_ARG</td>
<td>If an invalid callback type was supplied</td>
</tr>
</tbody>
</table>

7.3.4.2. Function `wdt_disable_callback()`

Disables asynchronous callback generation for a given type.

```c
enum status_code wdt_disable_callback(
    const enum wdt_callback type)
```

Disables asynchronous callbacks for a given callback type.

Table 7-12. Parameters

<table>
<thead>
<tr>
<th>Data direction</th>
<th>Parameter name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[in]</td>
<td>type</td>
<td>Type of callback function to disable</td>
</tr>
</tbody>
</table>

Returns

Status of the callback disable operation.

Table 7-13. Return Values

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_OK</td>
<td>The callback was disabled successfully</td>
</tr>
<tr>
<td>STATUS_ERR_INVALID_ARG</td>
<td>If an invalid callback type was supplied</td>
</tr>
</tbody>
</table>
7.4. **Enumeration Definitions**

7.4.1. **Callback Configuration and Initialization**

7.4.1.1. **Enum wdt_callback**

Enum for the possible callback types for the WDT module.

**Table 7-14. Members**

<table>
<thead>
<tr>
<th>Enum value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WDT_CALLBACK_EARLY_WARNING</td>
<td>Callback type for when an early warning callback from the WDT module is issued</td>
</tr>
</tbody>
</table>

7.4.2. **Enum wdt_period**

Enum for the possible period settings of the Watchdog timer module, for values requiring a period as a number of Watchdog timer clock ticks.

**Table 7-15. Members**

<table>
<thead>
<tr>
<th>Enum value</th>
<th>Description</th>
</tr>

8. Extra Information for WDT Driver

8.1. Acronyms

The table below presents the acronyms used in this module:

<table>
<thead>
<tr>
<th>Acronym</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WDT</td>
<td>Watchdog Timer</td>
</tr>
</tbody>
</table>

8.2. Dependencies

This driver has the following dependencies:

- System Clock Driver

8.3. Errata

There are no errata related to this driver.

8.4. Module History

An overview of the module history is presented in the table below, with details on the enhancements and fixes made to the module since its first release. The current version of this corresponds to the newest version in the table.

<table>
<thead>
<tr>
<th>Changelog</th>
</tr>
</thead>
<tbody>
<tr>
<td>Driver updated to follow driver type convention:</td>
</tr>
<tr>
<td>• wdt_init, wdt_enable, wdt_disable functions removed</td>
</tr>
<tr>
<td>• wdt_set_config function added</td>
</tr>
<tr>
<td>• WDT module enable state moved inside the configuration struct</td>
</tr>
</tbody>
</table>

Initial Release
9. **Examples for WDT Driver**

This is a list of the available Quick Start guides (QSGs) and example applications for SAM Watchdog (WDT) Driver. QSGs are simple examples with step-by-step instructions to configure and use this driver in a selection of use cases. Note that a QSG can be compiled as a standalone application or be added to the user application.

- Quick Start Guide for WDT - Basic
- Quick Start Guide for WDT - Callback

9.1. **Quick Start Guide for WDT - Basic**

In this use case, the Watchdog module is configured for:

- System reset after 2048 clocks of the Watchdog generic clock
- Always on mode disabled
- Basic mode, with no window or early warning periods

This use case sets up the Watchdog to force a system reset after every 2048 clocks of the Watchdog's Generic Clock channel, unless the user periodically resets the Watchdog counter via a button before the timer expires. If the Watchdog resets the device, a LED on the board is turned off.

9.1.1. **Setup**

9.1.1.1. **Prerequisites**

There are no special setup requirements for this use-case.

9.1.1.2. **Code**

Copy-paste the following setup code to your user application:

```c
void configure_wdt(void)
{
    /* Create a new configuration structure for the Watchdog settings and fill
    * with the default module settings. */
    struct wdt_conf config_wdt;
    wdt_get_config_defaults(&config_wdt);

    /* Set the Watchdog configuration settings */
    config_wdt.always_on = false;
    #if !((SAML21) || (SAMC21) || (SAML22))
        config_wdt.clock_source = GCLK_GENERATOR_4;
    #endif
    config_wdt.timeout_period = WDT_PERIOD_2048CLK;

    /* Initialize and enable the Watchdog with the user settings */
    wdt_set_config(&config_wdt);
}
```

Add to user application initialization (typically the start of `main()`):

```c
configure_wdt();
```
9.1.3. Workflow

1. Create a Watchdog module configuration struct, which can be filled out to adjust the configuration of the Watchdog.

```c
struct wdt_conf config_wdt;
```

2. Initialize the Watchdog configuration struct with the module's default values.

```c
wdt_get_config_defaults(&config_wdt);
```

Note: This should always be performed before using the configuration struct to ensure that all values are initialized to known default settings.

3. Adjust the configuration struct to set the timeout period and lock mode of the Watchdog.

```c
config_wdt.always_on = false;
#if !((SAML21) || (SAMC21) || (SAML22))
    config_wdt.clock_source = GCLK_GENERATOR_4;
#endif
config_wdt.timeout_period = WDT_PERIOD_2048CLK;
```

4. Setups the WDT hardware module with the requested settings.

```c
wdt_set_config(&config_wdt);
```

9.1.2. Quick Start Guide for WDT - Basic

9.1.2.1. Code

Copy-paste the following code to your user application:

```c
enum system_reset_cause reset_cause = system_get_reset_cause();

if (reset_cause == SYSTEM_RESET_CAUSE_WDT) {
    port_pin_set_output_level(LED_0_PIN, LED_0_INACTIVE);
} else {
    port_pin_set_output_level(LED_0_PIN, LED_0_ACTIVE);
}

while (true) {
    if (port_pin_get_input_level(BUTTON_0_PIN) == false) {
        port_pin_set_output_level(LED_0_PIN, LED_0_ACTIVE);
        wdt_reset_count();
    }
}
```

9.1.2.2. Workflow

1. Retrieve the cause of the system reset to determine if the Watchdog module was the cause of the last reset.

```c
enum system_reset_cause reset_cause = system_get_reset_cause();
```

2. Turn on or off the board LED based on whether the Watchdog reset the device.

```c
if (reset_cause == SYSTEM_RESET_CAUSE_WDT) {
    port_pin_set_output_level(LED_0_PIN, LED_0_INACTIVE);
} else {
    port_pin_set_output_level(LED_0_PIN, LED_0_ACTIVE);
}
```
3. Enter an infinite loop to hold the main program logic.
   
   ```
   while (true) {
   
   4. Test to see if the board button is currently being pressed.
   ```
   ```
   if (port_pin_get_input_level(BUTTON_0_PIN) == false) {
   ```
   ```
   5. If the button is pressed, turn on the board LED and reset the Watchdog timer.
   ```
   ```
   port_pin_set_output_level(LED_0_PIN, LED_0_ACTIVE);
   wdt_reset_count();
   ```

9.2. Quick Start Guide for WDT - Callback

In this use case, the Watchdog module is configured for:

- System reset after 4096 clocks of the Watchdog generic clock
- Always on mode disabled
- Early warning period of 2048 clocks of the Watchdog generic clock

This use case sets up the Watchdog to force a system reset after every 4096 clocks of the Watchdog's Generic Clock channel, with an Early Warning callback being generated every 2048 clocks. Each time the Early Warning interrupt fires the board LED is turned on, and each time the device resets the board LED is turned off, giving a periodic flashing pattern.

9.2.1. Setup

9.2.1.1. Prerequisites

There are no special setup requirements for this use-case.

9.2.1.2. Code

Copy-paste the following setup code to your user application:

```c
void watchdog_early_warning_callback(void)
{
    port_pin_set_output_level(LED_0_PIN, LED_0_ACTIVE);
}

void configure_wdt(void)
{
    /* Create a new configuration structure for the Watchdog settings and fill
    * with the default module settings. */
    struct wdt_conf config_wdt;
    wdt_get_config_defaults(&config_wdt);

    /* Set the Watchdog configuration settings */
    config_wdt.always_on = false;
    #if !((SAML21) || (SAMC21) || (SAML22))
        config_wdt.clock_source = GCLK_GENERATOR_4;
    #endif
    config_wdt.timeout_period = WDT_PERIOD_4096CLK;
    config_wdt.early_warning_period = WDT_PERIOD_2048CLK;

    /* Initialize and enable the Watchdog with the user settings */
    wdt_set_config(&config_wdt);
}
```
void configure_wdt_callbacks(void)
{
    wdt_register_callback(watchdog_early_warning_callback,
                          WDT_CALLBACK_EARLY_WARNING);
    wdt_enable_callback(WDT_CALLBACK_EARLY_WARNING);
}

Add to user application initialization (typically the start of main()):

configure_wdt();
configure_wdt_callbacks();

9.2.1.3. Workflow

1. Configure and enable the Watchdog driver.
   1. Create a Watchdog module configuration struct, which can be filled out to adjust the configuration of the Watchdog.
      
      ```c
      struct wdt_conf config_wdt;
      ```
   2. Initialize the Watchdog configuration struct with the module’s default values.
      
      ```c
      wdt_get_config_defaults(&config_wdt);
      ```
      
      Note: This should always be performed before using the configuration struct to ensure that all values are initialized to known default settings.
   3. Adjust the configuration struct to set the timeout and early warning periods of the Watchdog.
      
      ```c
      config_wdt.always_on            = false;
      #if !((SAML21) || (SAMC21) || (SAML22))
          config_wdt.clock_source         = GCLK_GENERATOR_4;
      #endif
      config_wdt.timeout_period       = WDT_PERIOD_4096CLK;
      config_wdt.early_warning_period = WDT_PERIOD_2048CLK;
      ```
   4. Sets up the WDT hardware module with the requested settings.
      
      ```c
      wdt_set_config(&config_wdt);
      ```

2. Register and enable the Early Warning callback handler.
   1. Register the user-provided Early Warning callback function with the driver, so that it will be run when an Early Warning condition occurs.
      
      ```c
      wdt_register_callback(watchdog_early_warning_callback,
                            WDT_CALLBACK_EARLY_WARNING);
      ```
   2. Enable the Early Warning callback so that it will generate callbacks.
      
      ```c
      wdt_enable_callback(WDT_CALLBACK_EARLY_WARNING);
      ```

9.2.2. Quick Start Guide for WDT - Callback

9.2.2.1. Code

Copy-paste the following code to your user application:

```c
port_pin_set_output_level(LED_0_PIN, LED_0_INACTIVE);

system_interrupt_enable_global();

while (true) {
```
/* Wait for callback */
}

9.2.2.2. Workflow

1. Turn off the board LED when the application starts.
   
   ```c
   port_pin_set_output_level(LED_0_PIN, LED_0_INACTIVE);
   ```

2. Enable global interrupts so that callbacks can be generated.
   
   ```c
   system_interrupt_enable_global();
   ```

3. Enter an infinite loop to hold the main program logic.
   
   ```c
   while (true) {
       /* Wait for callback */
   }
   ```
