Microchip’s PIC24 Microcontrollers and dsPIC® Digital Signal Controllers

Microchip’s PIC24 Microcontrollers (MCUs) and dsPIC® Digital Signal Controllers (DSCs) deliver more performance, low-power consumption, flexible peripherals and a complete development ecosystem of software and hardware tools to speed your development. With specialized offerings for motor control, digital power conversion, low-power security, advanced analog integration and functional safety, the 16-bit family offers a good balance between low cost, low power, high performance and robustness.

Microcontrollers for a Wide Range of Applications

Low-Power and General Embedded Applications – PIC24F MCUs

The PIC24F is a cost-effective, low-power family MCUs, featuring devices with eXtreme Low Power (XLP) technology, 16 MIPS performance and memory up to 1024 KB of Flash with a rich set of Core Independent Peripherals (CIPs). Our portfolio offers an upgrade in features and peripherals for applications that are pushing the boundaries of 8-bit MCU capabilities.

High Performance Embedded applications – dsPIC33 DSCs

The dsPIC33 Digital Signal Controllers (DSCs) accelerate Digital Signal Processor (DSP) performance for high-performance embedded applications. This family offers fast deterministic performance to address real-world design requirements. Offering up to 100 MIPS performance, the dsPIC33 family of DSCs is ideal for developing sophisticated real-time applications.

Motor Control Applications – dsPIC33 DSCs

The high-performance dsPIC33 DSCs feature a DSP engine for implementing high-efficiency, high-precision variable speed, constant torque PI control and Field Oriented Control (FOC) motor control. The dsPIC33 DSCs offer features such as:

• Dual independent cores offering performance up to 100 MIPS/core
• Integrated high-speed ADCs, Op-Amps, and Comparators for BoM cost reduction
• Up to 16 channel, high-resolution PWMs for two motor control and integrated PFC

Digital Power Conversion Applications – dsPIC33 DSCs

The high-performance dsPIC33 DSCs feature a DSP engine for very high-speed control loop execution in demanding power conversion applications. The dsPIC33 DSCs offer features like:

• Dual independent cores offering performance up to 100 MIPS/core, to separate time-critical control loops from housekeeping
• Tightly coupled PWM, high-speed ADCs, PGAs and CPU with fast and predictable interrupts
• High-resolution 250 pS PWMs with flexibility to control various power topologies
• Live update for real-time firmware upgrades in operating power supplies in servers with no downtime

With a high level of peripheral integration, the dsPIC33 family is ideal for industrial, automotive and consumer applications.

Robust and Safety Applications – PIC24 MCUs and dsPIC33 DSCs

The robust PIC24 MCUs and dsPIC33 DSCs feature dedicated peripherals and functions to help increase the reliability in safety-critical applications. These features facilitate to ensure end applications operate as intended, with safe shut down if any exception or issue occurs. With AEC Q100 qualification, the PIC24 MCUs and dsPIC33 DSCs offer 3V, 5V and up to 150°C operations.

Simplifying 16-bit Microcontroller Designs

With a focus on reducing the time to market and minimizing the development risk, Microchip offers a complete ecosystem.

• MPLAB® X IDE and XC16 compilers
  • Single platform across all 16-bit MCUs and DSCs
• MPLAB CodeConfigurator (MCC)
  • Enables prototyping in minutes
• Microchip-tested software for quick time to market
  • Bootloader, RTOS, USB, graphics, crypto, file I/O, Wi-Fi®, Class B safety stacks and DSP math libraries
• motorBench® development suite
  • Simplifies motor control designs
• Digital power design suite
  • Simplifies digital power designs
• Range of development boards
  • Cost-effective, rapid prototyping curiosity boards
  • Versatile explorer 16/32 development board
  • Motor control and digital power boards
Microchip offers a rich set of peripherals that help customers differentiate their end designs with real-time control and simple communication with other devices. The 16-bit family offers key communication and control peripherals like USB, SPI, UART, CAN-FD, I₂C, PWM and Timers, as well as specialized peripherals for graphics, motor control and digital power. Integrated analog peripherals like high-performance ADCs, DACs, PGAs and op amps, simplify analog designs and reduce BoM cost. In addition, core independent peripherals such as CLC, PTG and cryptographic accelerators enable higher levels of integration and flexibility. With dedicated peripherals and features enabling functional safety, the 16-bit family is ideal for robust and safety critical applications. To get a quick view into the 16-bit family, visit www.microchip.com/16bitquickreference.

dsPIC33C Single Core and Dual Core Digital Signal Controllers
Motor control, digital power, safety-critical and high-performance embedded applications come with an array of design challenges. The high-performance 100 MIPS dsPIC33C family of DSCs featuring a Digital Signal Processing (DSP) engine, offers fast deterministic performance to address real-world design challenges. The dsPIC33CH family features dual independent cores to simplify and speed up the firmware development whereas, the dsPIC33CK family offers a cost-effective single-core option with the same high-performance core and peripherals. www.microchip.com/dsPIC33C

Precision Motor Control
The dsPIC33 motor control families feature a high-performance core with specialized motor control peripherals. The devices are supported with motor-tuning development tools, free software libraries and motor control algorithms. Our flexible motor control development boards support a wide variety of motors and help reduce development time. www.microchip.com/motor

Efficiency for Digital Power Conversion
Intelligent power supply implementations solve problems in a wide range of applications, with power solutions implementing the most advanced digital control topologies. In such advanced designs, the digital controller integrate ADCs, digital control algorithms, and PWM generators to close the loop with firmware. The dsPIC33 DSCs are optimized for high performance on advanced algorithms for improved efficiency over widely varying load conditions. These devices feature dedicated peripherals such as fast ADCs, PGAs and PWMs for digital power conversion applications. www.microchip.com/power

eXtreme Low Power (XLP) Solutions
Microchip’s XLP devices bring together the design and process technologies needed to address today’s low-power applications. With sleep currents down to 10 nA and industry-leading integration including USB, touch, crypto and LCD drivers, XLP products can help extend the life of your battery-powered application. www.microchip.com/lowpower

Driving Displays
For applications that need compelling and intuitive user interfaces, our portfolio includes devices with integrated low-power segmented LCD drivers or colorful graphical display drivers with hardware acceleration. These hardware peripherals are supported by free software libraries to quickly integrate the display functions into your application with a single MCU. www.microchip.com/graphics www.microchip.com/LCD

Smart Connected Secure
Microchip provides total system solutions for smart, connected and secure designs. These designs can leverage everything from our smart PIC24 MCUs and dsPIC33 DSCs with integrated analog, certified wired and wireless connectivity and state-of-the-art security solutions along with ready-to-use software and tools, partnerships with the largest cloud computing companies and world-class support. www.microchip.com/PIC-IoT

Robust and Safety
PIC24 MCUs and dsPIC33 DSCs operate up to 5V for increased noise immunity and robustness. Additionally, most of the devices are rated for operation up to 125°C or 150°C ambient temperature for the most extreme automotive and industrial applications, including AEC-Q100 Grade 0 qualification. Several hardware peripherals and functions have been integrated into PIC24 and dsPIC33 devices to help increase the reliability and redundancy for these applications. Offering a comprehensive ecosystem, Microchip’s safety solution facilitates functional safety compliance of end applications. www.microchip.com/16bitFunctionalSafety
Scalable Dual- and Single-Core dsPIC33C Family

The dual-core dsPIC33CH DSCs have one core that is designed to function as master while the other is designed as a slave. The slave core can be used for executing dedicated, time-critical control code while the master core is busy running the user interface, system monitoring, and communications functions that are customized for your end application. The dsPIC33CH DSCs facilitate independent code development for each core by separate software teams and later enables seamless integration when the cores are brought together in one chip. If your design doesn’t require the dual cores, the cost-effective, single-core dsPIC33CK family of DSCs offers the same high-performance core and peripherals as the dsPIC33CH family.

These products offer fast deterministic performance to address real-world design requirements such as high energy efficiency across variable load conditions in a power supply or controlling the precise speed and rotation of a motor. The dsPIC33C devices are optimized for high-performance digital power, motor control and other high-performance embedded applications implementing sophisticated algorithms. This includes applications such as wireless power, server power supplies, drones, automotive sensors and digital power solutions for electric vehicles (EVs).

dsPIC33C DSC Advantages

- Simplified firmware development with dual independent cores
- Dual cores and peripheral sets facilitate robust systems and improve functional safety
- Up to two CAN-FDs for robust communication with increased bandwidth
- Maximum analog integration including high-speed ADCs, DACs with waveform generation, analog comparators and PGAs
- Live Update of firmware for high-availability systems, especially important for power supplies
- Single core option with same high performance with dsPIC33CK family

Motor Control

dsPIC33 Motor Control Products

- High-performance dsPIC33 DSC core with DSP instructions for precise control
  - Variable speed with constant torque using PI controllers
  - Field oriented control (FOC) for greater efficiency
- Dual core and single core dsPIC33 DSCs with up to 100 MIPS/core performance
  - Slave core provides speed and torque control by executing time-sensitive motor control algorithms
  - Master core runs functional safety routines, CAN-FD stack or other system-level functions
- Design different functions separately and integrate them seamlessly
- High-performance on-chip op-amps and comparators
- High-speed ADCs enabling simultaneous sampling
- Algorithms and application notes for
  - BLDC, PMSM, IPMSM, ACIM
  - Sensorless control
  - Field-oriented control
- Dual motor control with FOC control for each motor
- Multiple package options, ranging from 28 to 144 pins
- Low- and high-voltage motor control tools
- Motor control PWM: up to 16 outputs
  - Up to eight duty cycle generators
  - Independent or complementary mode
  - Programmable dead time settings
  - Edge- or center-aligned PWMs
  - Manual output override control, up to 10 fault inputs
  - ADC samples triggered by PWM module
- Quadrature Encoder Interface (QEI) modules
  - Phase A, Phase B and index pulse input
- High current sink/source
- Features enabling functional safety for compliance

Motor Control Development Solutions

Model-based Development with Simulink® and X2C
Microchip offers a rapid prototyping solution that allows compiling and flashing a simulation based model of a PMSM motor control system into a dsPIC33 DSC with a single push of a button using Simulink and X2C platforms. Microchip’s dsPIC33EP devices are supported with block-sets for both Matlab/Simulink and X2C/COS.
1. Load MPLAB X IDE with the X2C Plug in, or the MATLAB Plug in and Simulink tools on your computer
2. Build your Simulink/X2C model
3. Generate code for dsPIC33 using the MATLAB or X2C code generator plugins for MPLAB X
4. Compile the MPLAB X IDE project and load code onto target motor control development board
5. Connect your board to your motor
6. Run your code to spin the motor

For further information on Simulink tools, visit www.microchip.com/simplified. To download SCILAB X2C for free, visit https://www.microchip.com/Scilab_SCILAB_X2C

Motor Control Library for dsPIC33
This library is a collection of optimized functions designed to be used in developing 3-phase Motor Control applications on the dsPIC Digital Signal Controllers. All functions have input(s) and output(s), but do not access any of the DSC peripherals. The user’s motor control application interfaces to the DSC peripherals while using function calls into this library to perform a majority of the time-critical operations.

Advanced FOC Feature
Microchip provides source code and implementation examples for advanced FOC features to solve application challenges and improve reliability by supporting algorithms like:
- Field weakening
- Wind milling
- Initial Position Detection
- Stall detection and recovery
- Maximum Torque Per Ampere (MTPA)
- Soft stop
- Voltage, Torque and DC bus compensation
- Over modulation
- Angle Tracking Phase Locked Loop (AT-PLL) estimator

Visit www.microchip.com/Advanced-FOC to learn more.

motorBench® Development Suite
The motorBench Development Suite is an advanced GUI-based software development tool for FOC motor control capable of performing accurate measurement of critical motor parameters and automatic tuning of feedback control gains for dsPIC33 DSCs. For information, visit www.microchip.com/motorBench.

Air Conditioner Reference Design
Our Air Conditioner Reference Design, based on the dual-core dsPIC33CH family of Digital Signal Controllers (DSCs), demonstrates efficient control of the condenser fan, compressor, PFC and the overall application logic implementation. The high-performance dsPIC33C DSCs offer the right set of peripherals for dual-motor control and reduces the need for three controllers down to one for cost and space savings in your design.
www.microchip.com/aircon

Hardware Development Boards

dsPICDEM™ MCLV-2 Development Board (DM330021-2)
This board provides a cost-effective method of evaluating sensed or sensorless BLDC motor and PMSM control applications. It supports PIMs with dsPIC33 DSCs.

dsPICDEM MCHV-3 Development System (DM330023-3)
This high-voltage development system is targeted to control BLDC motors, PMSM and AC Induction Motors (ACIM) in sensor or sensorless operation. It includes a Power Factor Correction (PFC) circuitry.

Low-Voltage Motor Control Development Bundle (DV330100)
This bundle evaluating and developing dual/single motor control to drive BLDC motors or PMSMs concurrently. The dsPIC33 DSC Signal Board supports both 3.3V and 5V operated devices.

Low-Power High-Voltage Motor Control Reference Design (LPHV-MC-BOARD)
This cost-effective high voltage reference design board is targeted to efficiently control ACIM, PMSM and BLDC Motors in sensed or sensorless operations at a low power of up to 150W.
dsPIC33 Digital Power Conversion Products

- Streamlined interoperation between PWM, ADC and CPU
- High-performance core with DSP instructions
  - High-speed control loop execution for demanding power conversion applications
  - Fast and predictable interrupts
- Dual core and Single core dsPIC33C DSCs with up to 100 MIPS performance
  - Slave core implements control loop executing latency critical compensator algorithms
  - Master core runs PMBus stack and system-level functions
  - Design different functions separately and integrate them seamlessly
- High-resolution PWMs for digital power
  - 250 ps for duty cycle, phase shift, period and dead time for high switching frequency designs
  - Flexibility to control numerous power topologies
  - Configurable PWM Control Inputs for hardware response to external events that reduces control latency
- Live update features
  - Update all of the firmware without downtime
- Maximum analog integration including high-speed ADCs, DACs with waveform generation, comparators and PGAs
- 18–100 pins and packages as small as 4 × 4 mm

Digital Power Development Solutions

Reference Designs

15W Wireless Power Demonstration Board
This demo board based on the dsPIC33 DSC, is compatible with Qi medium power receivers. The development board enables a system efficiency of about 80% at full load.

Microchip 15W Multi-Coil Wireless Power Transmitter
The Three Coil Wireless Power Transmitter is based on the dsPIC33CH128MP506 device and implements a fixed frequency power control topology. The transmitter includes CAN for ease of integration into the automotive environment. The transmitter also enables the implementation of NFC.

200W Wireless Power Reference Design
The dsPIC33 DSC based 200W Wireless Power reference design is developed by Microchip design partner Fu Da Tong. The design implements a protocol developed from 27 granted U.S patents in communication, power control and foreign object detection.

750W AC/DC Reference Design
This Reference Design demonstrates a semi-bridgeless PFC topology followed by a peak current controlled zero-voltage switching full-bridge (ZVS FB) converter with digital slope compensation to achieve very high conversion efficiencies. This design showcases live update of firmware.

Platinum Rated 720 W AC/DC Reference Design
This dsPIC33 DSC based reference design has a peak efficiency of 94.1% and achieves the ENERGY STAR® CSCI Platinum Level. It features a 2-phase interleaved power factor correction boost converter followed by a 2-phase interleaved two-switch forward converter with synchronous rectification.

Quarter Brick DC/DC Converter Reference Design
This reference design provides an easy method to evaluate the performance and features of SMPS DSCs in high-density quarter brick DC-DC converters.

200W DC/DC LLC Resonant Converter Reference Design
This reference design operates over a wide input voltage range (350–420 VDC) while maintaining high-voltage isolation between the primary and secondary sides. High efficiency is achieved through Zero Voltage Switching (ZVS) on the half-bridge converter and Zero Current Switching (ZCS) on the synchronous rectifier.

Digital Power Interleaved PFC Reference Design
This reference design provides an easy method to evaluate the power and features of the SMPS dsPIC DSCs for IPFC applications. It features a universal input voltage range and produces a single high-voltage DC output up to 350W with low Total Harmonic Distortion (THD) of the input current.

Digital Pure Sine Wave Uninterruptible Power Supply (UPS) Reference Design
This reference design demonstrates how digital power techniques applied to UPS applications enable easy modifications through software and allow for the use of smaller magnetics, higher efficiency and reduction in audible and electrical noise via a purer sine-wave output, USB communication and reduce cost.

Grid Connected Solar Micro Inverter Reference Design
This reference design demonstrates maximum power point tracking for PV panel voltages between 20–45V DC and has a maximum output power of 215 W. High efficiency is achieved by implementing a novel interleaved active-clamp flyback topology with Zero Voltage Switching (ZVS).
Development Boards

**MPLAB Starter Kit for Digital Power (DM330017-2)**
This kit uses the dsPIC33EP64GS502 DSC to implement a buck converter and a boost converter. Each can drive its on-board MOSFET controlled resistive load or an external load.

**dsPIC33CH Curiosity Development Board (DM330028-2)**
This cost-effective board is a development platform for the dual core DSCs. The configurable test circuit can be operated in buck, boost or buck-boost modes, using either voltage mode or peak current mode control. The board also includes a configurable SMPS load step transient generator.

**dsPIC33EP128GS808 Development Board (DM330026)**
This board operates on a standalone basis or interfaces with CAN/LIN/J2602 PICtail™ (Plus) Board. The board contains single order RC filters to emulate power supply functionality in open or closed loop mode.

**Low Voltage PFC Development Kit (DV330101)**
Low Voltage Power Factor Correction (LVPFC) Development Kit offers safe voltage levels at moderate power while designing algorithms on a boost power factor correction topology. These algorithms can be applied on real systems under development with minimal changes.

Microchip’s Digital Power Design Suite
Microchip’s digital power design suite includes the Digital Compensation Design Tool (DCDT), MPLAB Code Configurator (MCC), SMPS Compensator Libraries and Design Examples. The suite offers tools and required guidance for a complete designs.

Digital Compensator Design Tool (DCDT)
DCDT helps power supply designers by simplifying the compensator coefficients calculations and analyzing the performance. This topology independent GUI offers advantages such as:
- Analyzing plant and feedback transfer functions
- Designing controller (PID, 2P2Z, 3P3Z, etc.)
- Migrating analog Type II, Type III to digital control
- Analyzing loop gain and tuning controller
- Generating coefficients and exporting to MPLAB X IDE

SMPS Compensator Library
The Compensator library includes optimized functions for the dsPIC33 DSCs that facilitate implementing common compensator algorithms and realize an efficient SMPS application design. The library supports:
- Algorithms such as PID, 2P2Z and 3P3Z
- Fixed point and trigger update
- Context registers on “GS” and “MP” family devices

MPLAB Code Configurator
MCC is a graphical programming environment that generates seamless, easy-to-understand device configuration code. It offers advantages such as:
- Intuitive interface for quick start and easy configuration
- Reduces overall design effort
- Minimizes references to product datasheet

Design Examples and Reference Designs
Royalty-free application-specific hardware and software:
- Starter kits/Development boards/EVBs
- Reference designs and application notes

Simplified SMPS Design Flow

Hardware
- Powertrain
- Feedback
- dsPIC® Controller

Firmware

- Extract Plant Characteristics
  - Simulation: MATLAB®/SIMPLIS
  - Small Signal Modeling
  - Network Analyzer

Digital Compensator Design Tool
- MPLAB® Code Configurator
- Microchip Compensator Libraries
- Microchip Example Code
16-bit Embedded Control Solutions

**PIC24F MCUs with eXtreme Low Power**

### eXtreme Low Power (XLP) Technology - PIC24F MCUs

Today’s connected applications must consume little power, and in extreme cases, last for over 20 years on a single battery. Microchip’s XLP technology offer the industry’s lowest Run and Sleep currents, ideal for a variety of applications including portable/wearable devices, remote controls, asset tracking, energy monitoring, security systems and IoT sensor nodes.

- Low sleep currents with flexible wake-up sources
- Sleep current down to 10 nA
- Brown-Out Reset (BOR) down to 45 nA
- Battery-friendly features
- Enable battery lifetime greater than 20 years
- Low-power supervisors for safe operation (BOR, WDT)
- **VBAT** battery back-up
- Automatic switch-over upon loss of VDD
- Maintains Real-Time Clock/Calendar (RTCC)
- Powered separately from 1.8–3.6V source (coin cell)
- Efficient instruction set; 90% single-cycle instruction
- Active mode current as low as 150 µA/MHz

### Migrating from 8-bit to 16-bit Microcontroller Families

Are your next design requirements increasing, requiring more performance, more Flash, more RAM or faster peripherals than are available on the PIC18 microcontroller (MCU) that you used in your original design? You can easily extend your application with more functionality by migrating your design from a PIC18 to a PIC24 MCU. Created as a powerful extension to Microchip’s existing PIC18 MCU portfolio, the PIC24F architecture gives you an even greater range of options for computational power and rich peripheral sets. At the same time, the architecture was tailored to keep as much of the existing PIC® MCU feature set and nomenclature as possible, making it easy to scale up or scale down your MCU if you are running out of or have an excess of resources in your application. [www.microchip.com/migration](http://www.microchip.com/migration)

### Development Tools

- **PIC24F Curiosity Board (DM240004) and PIC24FJ256GA7 Curiosity Board (DM240016)**
  These are cost-effective, fully integrated, rapid prototyping boards, featuring PIC24FJ128GA204 or PIC24FJ256GA705 XLP MCUs. The boards serve as a perfect platform to harness the power of low-power PIC24F MCUs.

- **Explorer 16/32 Development Board (DM240001-2)**
  This board is a modular development system supporting PIC24F XLP microcontrollers, providing a perfect platform to prototype applications using several expansion possibilities through its wide ecosystem support.

- **PIC-IoT WG Development Board (AC164164)**
  The PIC-IoT WG Development Board combines a powerful PIC24FJ128GA705 MCU, an ATECC608A CryptoAuthentication™ secure element IC and the fully-certified ATWINC1510 Wi-Fi network controller - which provides the most simple and effective way to connect your embedded application to the Google Cloud IoT Core. The board also includes an on-board debugger, and requires no external hardware to program and debug the MCU.

[www.microchip.com/lowpower](http://www.microchip.com/lowpower)
Display Many 16-bit designs incorporate modern user interfaces to increase the usability and functionality of end products. More sophisticated displays interfaces create higher impact designs, yet they must be cost effective and easy to integrate. Microchip’s solutions allow for driving segmented or graphical displays with a single chip and offer high-peripheral integration with low power.

Segmented LCD Displays
The Liquid Crystal Display (LCD) driver module generates the timing control to drive a Static or Multiplexed LCD panel and meets low power design requirements including driving the LCD display in sleep mode as well as software contrast control for boosting or dimming. The PIC24 “GA3”, “GC” and “GB4” families feature integrated segmented display drivers with up to 512 segments. Key advantages include:
- Direct drive of inexpensive, low-power displays
- Drive LCD while conserving power in low-power modes
- Integrated analog for sensor applications like temperature sensing in thermostats
- Integrated charge pump for contrast control even when powered from a low voltage battery
- Software contrast control for LCD using the internal biasing graphical displays

Graphical Displays
The PIC24FJ256DA210 family features integrated graphics acceleration and a display controller to directly drive displays up to 4.3” WQVGA with 480 × 272 resolution.
- Dedicated graphics clock for a continuous, flicker-free display
- On-chip display controller provides direct interface to TFT, STN and OLED displays
- Easy to use graphics processing units for hardware acceleration allow for moving and copying rectangles, decompressing images and rendering text without CPU intervention
- Integrated color look-up table and 96 KB frame buffer support up to 8 bpp QVGA with internal memory

Development Tools
LCD Explorer XLP Development Board (DM240314)
The LCD Explorer XLP Development Board provides an ideal platform to evaluate a MCU with a × 8 Common LCD driver on a 38 segment × 8 common LCD display.

PIC24FJ256DA210 Development Kit (DV164039)
This kit bundles the PIC24FJ256DA210 Development Board (DM240312), a 3.2” Truly 240 × 320 TFT Display Board (AC164127-4), three Graphics Display Prototype Boards (AC164139), the MPLAB ICD 3 Debugger (DV164035) and also includes a USB cable and accessories.

Software and Application Notes
Free Microchip Graphics Library
The Microchip Graphics Library is highly modular, easy to use and has an open documented interface for driver or controller support. It is available at www.microchip.com/MLA.
- Pre-made graphics objects, multiple fonts and languages
- User interface for mTouch® sensing
- Buttons, charts, check boxes, scroll bars, list boxes, images and basic animation

Visual Graphics Display Designer (SW500190)
Visual Graphics Display Designer (VGDD) by VirtualFab is a powerful visual design tool that provides a quick and easy way of creating Graphical User Interface (GUI) screens. This development environment fully utilizes the Microchip graphics library in MLA as well as Microchip’s graphics development boards.

Application Notes
- AN1428: Segmented LCD Biasing & Contrast Control Methods
- AN1368: Developing Graphics Applications Using an MCU with Integrated Graphics Controllers
Microchip provides total system solutions for smart, connected and secure designs. These designs can leverage everything from our smart PIC24 MCUs and dsPIC33 DSCs with integrated analog, certified wired and wireless connectivity and state-of-the-art security solutions along with ready-to-use software and tools, partnerships with the largest cloud computing companies and world-class support.

Secured System
As the attack surface of IoT devices continues to grow with clear acceleration, security can no longer be an afterthought. The PIC24 MCUs and dsPIC33 DSCs featuring various complementary protection schemes, can be easily interfaced with Microchip’s CryptoAuthentication devices to add security into your system.

Wireless Connectivity Solutions
With the massive growth of the Internet of Things, wireless connectivity has never been more important. Quickly incorporate connectivity to your designs with wireless ICs, modules, software and development kits that make connecting effortless for your customers.

Wi-Fi
• Pre-certified modules
• Popular cloud provider support
• Personal and enterprise security
• Extensive interoperability testing
• www.microchip.com/wifi

Bluetooth Low Energy
• Low power enables long battery life
• Small form factor
• Interoperable with Bluetooth 5
• www.microchip.com/bluetooth

LoRa
• Long range, up to 15 km
• Low power enables long battery life
• Global network and radio certification
• Certified LoRaWAN™ protocol stack
• www.microchip.com/LoRa

Wireless Communication

EtherCAT
• Microchip’s EtherCAT slave controllers integrate seamlessly with PIC24 MCUs and dsPIC33 DSCs to add EtherCAT communication.
• www.microchip.com/EtherCAT

PMBus™
• The PMBus protocol supported on dsPIC33 “GS” and “MP” families, operates over an I²C physical layer. A PMBus stack is available for free for use with dsPIC33 DSCs.

USB
• There are several PIC24 MCU and dsPIC33 DSC families with integrated USB, supporting device, host and On-The-Go (OTG) functionality.
• Microchip’s free USB stack framework includes libraries supporting Human Interface Device (HID), Mass Storage Device (MSD), CDC, PHDC, custom, audio, printer and demo code including thumb drive bootloader and printer host.

SENT and LIN
• The dsPIC33 family features SENT for point-to-point transmission of sensor values
• LIN support is integrated into products for low-cost, single-wire serial communication for automotive applications.

PIC-IoT WG Development Board
The PIC-IoT WG development board combines a powerful PIC24FJ128GA705 MCU, an ATECC608A CryptoAuthentication™ secure element IC and the fully certified ATWINC1510 Wi-Fi network controller - which provides the most simple and effective way to connect your embedded application to Google’s Cloud IoT core platform. To learn more, visit www.microchip.com/PIC-IoT.
Functional Safety and Robust Usages

Functional Safety Ready

In today’s automotive applications, ISO26262 has become a critical element of passenger safety, as electric and electronic content has rapidly grown within cars and now mobility solutions to a wider extent. To help customers achieve the desired Automotive Safety Integrity Level (ASIL) certification, Microchip’s dsPIC33 family of Digital Signal Controllers (DSCs) is commonly used in digital-power and motor-control applications for the automotive market including DC/DC systems and On-Board Chargers (OBC), actuators and also sensors (position, pressure) for which ASIL requirements apply.

Select dsPIC33 DSCs are products that contains the “Functional Safety Ready” designation. It has been carefully selected as one that encompasses the latest features and support collateral available from Microchip, including integrated safety features, safety manuals, Failure Mode, effect, diagnostic analysis (FMEDA) reports and in some cases, diagnostic software.

Safety and Robustness Collateral
- Automotive-grade silicon (Q100 qualification, up to Grade 0)
- Functional Safety Diagnostic Firmware (with complete requirements mapping, static/dynamic analysis and test reports)
- Failure modes, Effects and Diagnostic Analysis report
- Functional Safety Manual
- MPLAB XC Functional Safety Certified Compilers
- MCAL Drivers for Autosar

These collaterals are available under NDA upon request from your local Microchip Sales office.

Make your certification process easier and less risky with Microchip high-quality collateral.

Applications
- On-Board Chargers (OBC)
- Battery Management Systems (BMS)
- Sensors (position, pressure)

Safety and Robustness Capabilities

The dsPIC33 family of DSCs provide the following features and capabilities for robust environments:

Hardware functional safety features including but not limited to:
- Memory: ECC, CRC, RAM BIST
- System: DMT, WDT/Windowed WDT, POR/BOR, MCLR
- Clocking: Redundant Oscillator, Fail Safe Clock Monitor (FSCM)
- CPU: Error Trap Monitors
- GPIO: ESD Protection, I/O Port Readback

Development Tools

Microchip offers a number of products that enable system-level compliance to functional safety. This means that they have integrated features, qualified test libraries, safety manuals, and FMEDA reports, depending on the standard and the level of safety they support. All these items make it easier to develop applications that conform to the functional safety standards, and thereby reduce the work and cost of the final product compliance. Microchip offers the MPLAB® XC Compiler, ISO 26262 qualified up to ASIL D.

Third Party Support
- LDRA software technology
- TÜV SÜD

Additional Information
- Some of these hardware features apply to Class B appliance applications.

www.microchip.com/16bitfunctionalsafety
Development and Evaluation Tools

A variety of hardware development boards are available for the PIC24 and dsPIC33 products, enabling you to shorten your design cycle and quickly develop prototypes. These boards are designed to allow easy connectivity to an MPLAB ICD 4 In-Circuit Debugger, MPLAB REAL ICE™ In-Circuit Emulator or MPLAB PICkit 4. Many boards also include integrated debugger and programmers. When combined with the MPLAB X IDE and the MPLAB XC16 Compiler, these development boards and starter kits allow you to quickly gain knowledge and experience using Microchip’s 16-bit MCU and dsPIC DSC products.

The new Explorer 16/32 Development Board is a modular development system supporting PIC24, dsPIC33 and PIC32 devices. The board comes with several new features including an integrated programmer/debugger, on-board USB communication and USB-to-serial communication bridge. The board’s wide ecosystem includes mikroBUS™, Pmod and PICtail™ Plus interfaces that support Click board™, Pmod boards and PICtail Plus daughter cards. Full documentation is available at [www.microchip.com/Explorer1632](http://www.microchip.com/Explorer1632).

The PIC24F Curiosity Development Board is a cost-effective, fully integrated, feature-rich, rapid prototyping platform featuring the PIC24FJ128GA204 XLP MCU. The board serves as the perfect platform to harness the power of 16-bit PIC24 MCUs.

The PIC24FJ256GA7 Curiosity Board is a cost-effective, fully integrated 16-bit development platform that enables easy and faster adoption of low-cost XLP 16-bit PIC24FJ256GA705 family of microcontrollers.

The PIC-IoT WG Development Board combines a powerful PIC24FJ128GA705 MCU, an ATCC608A CryptoAuthentication™ secure element IC and the fully-certified ATWINC1510 Wi-Fi® network controller - which provides the most simple and effective way to connect your embedded application to the Google Cloud IoT Core. The board also includes an on-board debugger, and requires no external hardware to program and debug the MCU.

The dsPIC33CH Curiosity board is a development and demo platform for the dsPIC33CH512MP508 family of dual core high performance DSCs. The board features an integrated programmer/debugger and mikroBUS interfaces. The configurable Switch Mode Power Supply (SMPS) test circuit on the board can be operated in buck, boost or buck-boost modes. It includes a configurable load step transient generator.

The dsPIC33CK Curiosity Development Board (DM330030) is a cost-effective development and demonstration platform for the dsPIC33CK family of single-core high performance digital signal controllers. Designed to take full advantage of Microchip’s MPLAB® X IDE, the board includes an integrated programmer/debugger and requires no additional hardware, making it a perfect starting point to explore the dsPIC33CK family.

This USB-powered starter kit features the dsPIC33EV256GM106 with connections for CAN, LIN and SENT, as well as integrated programmer and debugger.

This board includes the dsPIC33EP64GS502 digital power conversion device to implement a DC/DC synchronous buck converter power stage and boost converter power stage. Each power stage includes a MOSFET controlled 5W resistive load. The board includes a display for voltage, current, temperature and fault conditions and integrated programmer and debugger, all powered by 9V power supply.

Low Voltage Power Factor Correction (LVFPC) Development Kit offers safe voltage levels at moderate power while designing algorithms on a boost power factor correction topology. These algorithms can be applied on real systems under development with minimal changes.
Software Libraries and Tools

Software libraries, code examples and application notes are available to support the PIC24 MCUs and dsPIC33 DSCs. The table below includes some of the most popular software libraries and tools that help you jump start your application development.

Microchip’s Development Ecosystem

**MPLAB X IDE**

**Universal and Integrated Tool Set**
MPLAB X IDE is a single, universal graphical user interface for Microchip and third-party software and hardware development tools. It is the industry’s only IDE to support an entire portfolio of 8-bit, 16-bit and 32-bit PIC MCUs, dsPIC DSCs and memory devices.

**Powerful Yet User-Friendly Interface**
With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code-completion, context menus and a task navigator, MPLAB X IDE is flexible and friendly enough for new users.

**Open-Source Platform**
Based on the NetBeans™ Platform, MPLAB X IDE supports a host of free software components and plug-ins from the NetBeans community. It is compatible across Windows®, Linux® or Mac OS® X.

---

**MPLAB Code Configurator (MCC)**
MPLAB Code Configurator is a free graphical programming environment that generates seamless, easy to-understand C code. It is incorporated into MPLAB X IDE to provide a powerful and easy-to-use development platform. Supporting 8-, 16- and 32-bit PIC MCUs, including PIC24, dsPIC33 and PIC32MM families, MCC can be used to jumpstart your next design.

- Free graphical programming environment
- Intuitive interface for quick start development
- Automated configuration of peripherals & functions
- Minimized reliance upon product datasheet
- Reduces overall design effort & time

**MCC supports Click board™**
To help you bring your ideas to life even faster, MCC supports quick-start software libraries for MikroElektronika click boards to prototype your design without the stress and hassle of low level code development and validation.

**Three Easy Ways to Get MCC**
- Install the MPLAB X IDE plugin
- Use MPLAB Xpress IDE
- Manually install the MPLAB X IDE plugin

---

**MPLAB XC16 Compiler for PIC24 MCUs and dsPIC DSCs**
The MPLAB XC16 Compiler includes a complete ANSI C standard library with a powerful code optimizer. Other 16-bit MCU compilers generate as much as 165% larger code for the same application. The assembler comes with the MPLAB XC Compiler and may be used with the compiler or as an assembler.

Support
Microchip is committed to supporting its customers in developing products faster and more efficiently. We maintain a worldwide network of field applications engineers and technical support ready to provide product and system assistance. For more information, please visit www.microchip.com:
  • Technical Support: www.microchip.com/support
  • Evaluation samples of any Microchip device: www.microchip.com/sample
  • Knowledge base and peer help: www.microchip.com/forums
  • Sales and Global Distribution: www.microchip.com/sales

Training
If additional training interests you, Microchip offers several resources including in-depth technical training and reference material, self-paced tutorials and significant online resources.
  • Overview of Technical Training Resources: www.microchip.com/training
  • MASTERS Conferences: www.microchip.com/masters
  • Developer Help Website: www.microchip.com/developerhelp
