### DESCRIPTION

The LX8213 LDO regulator is part of Microsemi's family of positive voltage regulator ICs using CMOS technology. The device provides a compact and cost-effective solution featuring low power consumption over a wide supply voltage range, high output voltage accuracy, low dropout, excellent line and load regulation, fast transient response, and low noise.

The LX8213 operates over a wide input voltage range of 2.5V to 6V, and consumes only 60uA typical quiescent current at no load and a low 0.1uA shutdown current. Output voltage options include fixed 1.2V, 3.3V, or an adjustable output voltage which may be set from 1.2V to 5.5V. The LDO delivers up to 300mA of output current, with a foldback current limit of approximately 400mA. At 300mA load, dropout voltage measures only 170mV for a 3.3V output.

Tight load and line regulation is achieved over the full output current and supply range. The high bandwidth control loop provides fast transient response to reduce output voltage deviation using low cost external ceramic capacitors in the 1uF range.

The LX8213 also exhibits low output noise with only 60uVRMS over a 100kHz bandwidth. Power supply rejection exceeds 65dB at 100Hz.

Other features of LX8213 include an active low shutdown input with a 3MΩ internal pull-down for low cost power sequencing, internal soft-start circuitry to prevent inrush current, short circuit current limit, and thermal overload protection.

The LX8213 operates over -40°C to +85°C ambient temperature range and is available in a tiny 5 pin SOT-23 ROHS compliant package.

### KEY FEATURES

- 2.5V to 6V Wide Input Voltage Range
- Fixed Output at 1.2V or 3.3V
- Adjustable Output Voltage Range from 1.2V to 5.5V
- Low Quiescent Current of Typical 60uA
- Low Dropout Voltage of Typical 170mV at 3.3V 300mA
- Stable with Low ESR 1uF Input/Output Bypass Ceramic Capacitors
- Ultra Low Shutdown Current of Typical 0.1uA
- Low Output Noise of Typical 60uV RMS at VOUT=1.2V
- Fast Transient Response
- Shutdown Control Input
- Foldback Current Limit
- 50mA Short Circuit Limit
- Over Temperature Protection
- Standard Package SOT-23
- RoHS Compliant

### APPLICATIONS

- Battery Operated Systems
- Set-Top Box
- LCD TV's
- Routers
- Video Cards
- Hand Held Instruments

LX8213-00ISE  (Adjustable) Marking “ADYWYL”
LX8213-12ISE  (1.2V Fixed Output) Marking “AKYWYL”
LX8213-33ISE  (3.3V Fixed Output) Marking “ALYWYL”

*Marking explanation:

A – Output Reference. ‘AD’ – Adjustable Output
‘AK’ – 1.2V Fixed Output
‘AL’ – 3.3V Fixed Output

Y – Numerical single digit year reference. (‘0’, ‘1’, ‘2’…’9’)

W – Bi-weekly code. (‘A’ for 1st-2nd week, ‘B’ for 3rd-4th week, ‘C’ for 5th-6th week)

L – Numerical single digit sub-build lot identity. (‘0’, ‘1’, ‘2’…’9’)

Note: Available in Tape & Reel. Append the letters “TR” to the part number. (i.e. LX8213-xxISE-TR)

### THERMAL DATA

<table>
<thead>
<tr>
<th>T_A (°C)</th>
<th>THERMAL RESISTANCE - JUNCTION TO AMBIENT</th>

Figure 3 – LX8213-00 Adjustable Output Application Schematic
Description

The LX8213 is a family of CMOS based LDO (Low Drop-Out) regulators in a small 5 pin SOT-23 package that provides a compact and cost effective solution. The LX8213 is offered with fixed output voltages of 1.2V or 3.3V, in addition to an adjustable version with an output voltage range of 1.2V to 5.5V. The LX8213 features low power consumption over a wide supply voltage range, high output voltage accuracy, low dropout, excellent line and load regulation, fast transient response, and low noise. Please refer to the Electrical Characteristics Table for the specifications.

Input Capacitor

To improve load transient response and noise rejection, an input bypass capacitor is recommended, but it is not required for stability. There are no requirements for the ESR (Equivalent Series Resistor) on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitor will be around 1µF over the entire operating temperature range. Capacitors with X5R or X7R characteristics are recommended.

Output Capacitor

For stability of the regulator, use a minimum 1uF capacitor to bypass from VOUT to GND. Note that the LX8213 is stable using low ESR ceramic capacitors. Capacitors with X5R or X7R characteristics generally perform well and are recommended.

Adjustable Output Voltage

The LX8213-00 output voltage can be set within the range of 1.2V to 5.5V by connecting the FB pin to an external resistor divider (See Figure 3). The output voltage can be calculated using:

\[ V_{OUT} = 0.8 \left[ \frac{R1}{1 + \frac{R2}{R1}} \right] \]

R2 is chosen to minimize the power dissipated by the resistor divider network while providing enough FB input bias current. A value of 8.06kΩ is recommended.

Shutdown (SHDN)

The LX8213 includes an active low shutdown input (SHDN). When the SHDN pin is left floating, an internal pull down resistor to GND of 3MΩ will automatically disable the device. Upon shutdown, an internal MOSFET connected from VOUT to GND will be turned ON to discharge the output capacitor.

To enable the regulator, set SHDN to logic high. If shutdown capability is not required, connect SHDN pin to VIN. For specification on minimum and maximum logic high levels, please refer to the Electrical Characteristics Table.

Foldback Current Limit

The LX8213 uses a foldback current limit. When the load current exceeds approximately 400mA, the output voltage is reduced along with the output current, minimizing power dissipated and protecting the device from excessive heating.

Short Circuit Current Protection

Under conditions where the output of the LX8213 is shorted to ground, internal circuitry will limit the device to source only about 50mA.

Temperature Protection

The thermal protection shuts down the LX8213 when the junction temperature exceeds approximately 165°C, with a hysteresis of about 30°C.

Thermal Consideration

Thermal shutdown protects the integrated circuit from thermal overload caused from a rise in junction temperature during power dissipation. This means the protection is intended for fault protection only and not as a means of current or power limiting during normal application usage. Proper thermal evaluation should be done to ensure that the junction temperature does not exceed its maximum rating. Operating at the maximum TJ of 150°C can impact reliability. Due to variation in individual device electrical characteristics and thermal resistance, the built in thermal overload protection may be activated at power levels slightly above or below the rated dissipation.

Power dissipation for regulator can be calculated using the following equation:

\[ P_D = (V_{IN(MAX)} - V_{OUT(MIN)}) \cdot I_{OUT(MAX)} \]

(Note: power dissipation resulting from quiescent current is negligible)

For the SOT23 package, thermal resistance, \(\theta_{JA}\) is 250°C/W when mounted on a FR4 copper clad PCB. Junction temperature of the integrated circuit can be calculated using:

\[ TJ = TA + TRISE, \text{ substituting: } TA + (P_D \cdot \theta_{JA}) \]

An example: Given conditions: \(TA = 25°C\), \(V_{IN} = 2.5V\), \(V_{OUT} = 1.2V\), \(I_{OUT} = 200mA\).

Calculated values:

Total Power dissipation \(P_{D(total)} = (2.5-1.2) V \cdot 0.2A = 0.26W\)

Junction Temperature \(T_J = 25°C + (0.26W \cdot 250°C/W) = 90°C\)
