Features

- 8-Bit Remote Bidirectional I/O Port
  - I/O pins default to input
- High-Speed I\(^2\)C Interface (MCP23008)
  - 100 kHz
  - 400 kHz
  - 1.7 MHz
- High-Speed SPI Interface (MCP23S08)
  - 10 MHz
- Hardware Address Pins
  - Three for the MCP23008 to allow up to eight devices on the bus
  - Two for the MCP23S08 to allow up to four devices using the same Chip Select
- Configurable Interrupt Output Pin
  - Configurable as active-high, active-low or open-drain
- Configurable Interrupt Source
  - Interrupt-on-change from configured defaults or pin change
- Polarity Inversion Register to Configure the Polarity of the Input Port Data
- External Reset Input
- Low Standby Current: 1 µA (max.)
- Operating Voltage:
  - 1.8V to 5.5V at -40°C to +85°C
    - I\(^2\)C at 100 kHz
    - SPI at 5 MHz
  - 2.7V to 5.5V at -40°C to +85°C
    - I\(^2\)C at 400 kHz
    - SPI at 10 MHz
  - 4.5V to 5.5V at -40°C to +125°C
    - I\(^2\)C at 1.7 kHz
    - SPI at 10 MHz

Packages

- 18-pin PDIP (300 mil)
- 18-pin SOIC (300 mil)
- 20-pin SSOP
- 20-pin QFN

1.0 DEVICE OVERVIEW

The MCP23X08 device provides 8-bit, general purpose, parallel I/O expansion for I²C bus or SPI applications. The two devices differ in the number of hardware address pins and the serial interface:

- MCP23008 – I²C interface; three address pins
- MCP23S08 – SPI interface; two address pins

The MCP23X08 consists of multiple 8-bit Configuration registers for input, output and polarity selection. The system master can enable the I/Os as either inputs or outputs by writing the I/O Configuration bits. The data for each input or output is kept in the corresponding Input or Output register. The polarity of the Input Port register can be inverted with the Polarity Inversion register. All registers can be read by the system master.

</table>

The interrupt output can be configured to activate under two conditions (mutually exclusive):

1. When any input state differs from its corresponding Input Port register state, this is used to indicate to the system master that an input state has changed.
2. When an input state differs from a preconfigured register value (DEFVAL register).

The Interrupt Capture register captures port values at the time of the interrupt, thereby saving the condition that caused the interrupt.

The Power-on Reset (POR) sets the registers to their default values and initializes the device state machine.

The hardware address pins are used to determine the device address.
1.2 Power-on Reset (POR)

The on-chip POR circuit holds the device in Reset until VDD has reached a high enough voltage to deactivate the POR circuit (i.e., release the device from Reset). The maximum VDD rise time is specified in Section 2.0, Electrical Characteristics.

When the device exits the POR condition (releases Reset), device operating parameters (i.e., voltage, temperature, serial bus frequency, etc.) must be met to ensure proper operation.

1.3 Serial Interface

This block handles the functionality of the I2C (MCP23008) or SPI (MCP23S08) interface protocol. The MCP23X08 contains eleven registers that can be addressed through the serial interface block (Table 1-2):

1.3.1 SEQUENTIAL OPERATION BIT

The Sequential Operation (SEQOP) bit (IOCON register) controls the operation of the Address Pointer. The Address Pointer can either be enabled (default) to allow the Address Pointer to increment automatically after each data transfer, or it can be disabled.

When operating in Sequential mode (IOCON.SEQOP = 0), the Address Pointer automatically increments to the next address after each byte is clocked.

When operating in Byte mode (IOCON.SEQOP = 1), the MCP23X08 does not increment its address counter after each byte during the data transfer. This gives the ability to continually read the same address by providing extra clocks (without additional control bytes). This is useful for polling the GPIO register for data changes.

1.3.2 I2C INTERFACE

1.3.2.1 I2C Write Operation

The I2C Write operation includes the control byte and register address sequence, as shown in the bottom of Figure 1-1. This sequence is followed by eight bits of data from the master and an Acknowledge (ACK) from the MCP23008. The operation is ended with a STOP or RESTART condition being generated by the master.

Data is written to the MCP23008 after every byte transfer. If a STOP or RESTART condition is generated during a data transfer, the data will not be written to the MCP23008.

Byte writes and sequential writes are both supported by the MCP23008. The MCP23008 increments its address counter after each ACK during the data transfer.

1.3.2.2 I2C Read Operation

The I2C Read operation includes the control byte sequence, as shown in the bottom of Figure 1-1. This sequence is followed by another control byte (including the START condition and ACK) with the R/W bit equal to a logic ‘1’ (R/W = 1). The MCP23008 then transmits the data contained in the addressed register. The sequence is ended with the master generating a STOP or RESTART condition.

1.3.2.3 I2C Sequential Write/Read

For sequential operations (Write or Read), instead of transmitting a STOP or RESTART condition after the data transfer, the master clocks the next byte pointed to by the Address Pointer (see Section 1.3.1 “Sequential Operation Bit” for details regarding sequential operation control).

The sequence ends with the master sending a STOP or RESTART condition.

The MCP23008 Address Pointer will roll over to address zero after reaching the last register address. Refer to Figure 1-1.

1.3.3 SPI INTERFACE

1.3.3.1 SPI Write Operation

The SPI Write operation is started by lowering CS. The Write command (slave address with R/W bit cleared) is then clocked into the device. The opcode is followed by an address and at least one data byte.

1.3.3.2 SPI Read Operation

The SPI Read operation is started by lowering CS. The SPI Read command (slave address with R/W bit set) is then clocked into the device. The opcode is followed by an address, with at least one data byte being clocked out of the device.
1.3.3.3 SPI Sequential Write/Read

For sequential operations, instead of deselecting the device by raising CS, the master clocks the next byte pointed to by the Address Pointer.

The sequence ends by the raising of CS.

The MCP23S08 Address Pointer will roll over to address zero after reaching the last register address.

1.4 Hardware Address Decoder

The hardware address pins are used to determine the device address. To address a device, the corresponding address bits in the control byte must match the pin state.

- MCP23008 has address pins A2, A1 and A0.
- MCP23S08 has address pins A1 and A0.

The pins must be biased externally.
1.4.1 ADDRESSING I\(^2\)C DEVICES (MCP23008)

The MCP23008 is a slave I\(^2\)C device that supports 7-bit slave addressing, with the read/write bit filling out the control byte. The slave address contains four fixed bits and three user-defined hardware address bits (pins A2, A1 and A0). Figure 1-2 shows the control byte format.

1.4.2 ADDRESSING SPI DEVICES (MCP23S08)

The MCP23S08 is a slave SPI device. The slave address contains five fixed bits and two user-defined hardware address bits (pins A1 and A0), with the read/write bit filling out the control byte. Figure 1-3 shows the control byte format.
1.5 GPIO Port

The GPIO module contains the data port (GPIO), internal pull-up resistors and the Output Latches (OLAT).

Reading the GPIO register reads the value on the port. Reading the OLAT register only reads the OLAT, not the actual value on the port.

Writing to the GPIO register actually causes a write to the OLAT. Writing to the OLAT register forces the associated output drivers to drive to the level in OLAT. Pins configured as inputs turn off the associated output driver and put it in high-impedance.

1.6 Configuration and Control Registers

The Configuration and Control blocks contain the registers as shown in Table 1-3.

<table>

* Not used on the MCP23008.
1.6.1 I/O DIRECTION (IODIR) REGISTER

Controls the direction of the data I/O.

When a bit is set, the corresponding pin becomes an input. When a bit is clear, the corresponding pin becomes an output.

**REGISTER 1-1: IODIR – I/O DIRECTION REGISTER (ADDR 0x00)**

bit 7-0  **IO7:IO0:** These bits control the direction of data I/O [7:0]

1 = Pin is configured as an input
0 = Pin is configured as an output
1.6.2  INPUT POLARITY (IPOL) REGISTER

The IPOL register allows the user to configure the polarity on the corresponding GPIO port bits. If a bit is set, the corresponding GPIO register bit will reflect the inverted value on the pin.

REGISTER 1-2:  IPOL – INPUT POLARITY PORT REGISTER (ADDR 0x01)

<table>
<thead>
<tr>
<th>R/W-0</th>

bit 7-0  IP7:IP0: These bits control the polarity inversion of the input pins [7:0]

1 = GPIO register bit will reflect the opposite logic state of the input pin
0 = GPIO register bit will reflect the same logic state of the input pin

Legend:
R = Readable bit  W = Writable bit  U = Unimplemented bit, read as ‘0’
-n = Value at POR  ‘1’ = Bit is set  ‘0’ = Bit is cleared  x = Bit is unknown
1.6.3 INTERRUPT-ON-CHANGE
CONTROL (GPINTEN) REGISTER

The GPINTEN register controls the interrupt-on-change feature for each pin.
If a bit is set, the corresponding pin is enabled for interrupt-on-change. The DEFVAL and INTCON
registers must also be configured if any pins are enabled for interrupt-on-change.

REGISTER 1-3: GPINT – INTERRUPT-ON-CHANGE PINS (ADDR 0x02)

<table>
<thead>
<tr>
<th>R/W-0</th>
<th>R/W-0</th>

Legend:
R = Readable bit
W = Writable bit
U = Unimplemented bit, read as ‘0’
-n = Value at POR
‘1’ = Bit is set
‘0’ = Bit is cleared
x = Bit is unknown

bit 7-0 GPINT7:GPINT0: General Purpose I/O Interrupt-on-Change [7:0]
1 = Enable GPIO input pin for interrupt-on-change event
0 = Disable GPIO input pin for interrupt-on-change event

Refer to INTCON and GPINTEN.
1.6.4 DEFAULT COMPARE (DEFVAL)
REGISTER FOR INTERRUPT-ON-CHANGE

The default comparison value is configured in the DEFVAL register. If enabled (via GPINTEN and INTCON) to compare against the DEFVAL register, an opposite value on the associated pin will cause an interrupt to occur.

REGISTER 1-4: DEFVAL – DEFAULT VALUE REGISTER (ADDR 0x03)

<table>
<thead>
<tr>
<th>R/W-0</th>
<th>R/W-0</th>
<th>R/W-0</th>
<th>R/W-0</th>
<th>R/W-0</th>
<th>R/W-0</th>

<th>R/W-0</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEF7</td>
<td>DEF6</td>
<td>DEF5</td>
<td>DEF4</td>
<td>DEF3</td>
<td>DEF2</td>
<td>DEF1</td>
<td>DEF0</td>
</tr>
</tbody>
</table>

bit 7-0 DEF7:DEF0: These bits set the compare value for pins configured for interrupt-on-change from defaults [7:0]. Refer to INTCON.
If the associated pin level is the opposite from the register bit, an interrupt occurs.
Refer to INTCON and GPINTEN.
1.6.5 INTERRUPT CONTROL (INTCON) REGISTER

The INTCON register controls how the associated pin value is compared for the interrupt-on-change feature. If a bit is set, the corresponding I/O pin is compared against the associated bit in the DEFVAL register. If a bit value is clear, the corresponding I/O pin is compared against the previous value.

REGISTER 1-5: INTCON – INTERRUPT-ON-CHANGE CONTROL REGISTER (ADDR 0x04)

<table>
<thead>
<tr>
<th>R/W-0</th>
<th>R/W-0</th>

- W = Writable bit
- U = Unimplemented bit, read as ‘0’
- -n = Value at POR
- ‘1’ = Bit is set
- ‘0’ = Bit is cleared
- x = Bit is unknown

bit 7-0   IOC7:IOC0: These bits control how the associated pin value is compared for interrupt-on-change [7:0]

1 = Controls how the associated pin value is compared for interrupt-on-change
0 = Pin value is compared against the previous pin value

Refer to INTCON and GPINTEN.
1.6.6 CONFIGURATION (IOCON) REGISTER

The IOCON register contains several bits for configuring the device:

- The Sequential Operation (SEQOP) controls the incrementing function of the Address Pointer. If the Address Pointer is disabled, the Address Pointer does not automatically increment after each byte is clocked during a serial transfer. This feature is useful when it is desired to continuously poll (read) or modify (write) a register.

- The Slew Rate (DISSLW) bit controls the slew rate function on the SDA pin. If enabled, the SDA slew rate will be controlled when driving from a high to a low.

- The Hardware Address Enable (HAEN) control bit enables/disables the hardware address pins (A1, A0) on the MCP23S08. This bit is not used on the MCP23008. The address pins are always enabled on the MCP23008.

- The Open-Drain (ODR) control bit enables/disables the INT pin for open-drain configuration.

- The Interrupt Polarity (INTPOL) control bit sets the polarity of the INT pin. This bit is functional only when the ODR bit is cleared, configuring the INT pin as active push-pull.

**REGISTER 1-6: IOCON – I/O EXPANDER CONFIGURATION REGISTER (ADDR 0x05)**

<table>
<thead>
<tr>
<th>U-0</th>
<th>U-0</th>
<th>R/W-0</th>
<th>R/W-0</th>

**Legend:**
R = Readable bit  W = Writable bit  U = Unimplemented bit, read as '0'
-n = Value at POR  ‘1’ = Bit is set  ‘0’ = Bit is cleared  x = Bit is unknown

- **bit 7-6 Unimplemented:** Read as ‘0’
- **bit 5 SEQOP:** Sequential Operation Mode
  1 = Sequential operation disabled, Address Pointer does not increment
  0 = Sequential operation enabled, Address Pointer increments
- **bit 4 DISSLW:** Slew Rate Control Bit for SDA Output
  1 = Slew rate disabled
  0 = Slew rate enabled
- **bit 3 HAEN:** Hardware Address Enable (MCP23S08 only)
  Address pins are always enabled on MCP23008.
  1 = Enables the MCP23S08 address pins
  0 = Disables the MCP23S08 address pins
- **bit 2 ODR:** This bit configures the INT pin as an open-drain output
  1 = Open-drain output (overrides the INTPOL bit)
  0 = Active driver output (INTPOL bit sets the polarity)
- **bit 1 INTPOL:** This bit sets the polarity of the INT output pin
  1 = Active-high
  0 = Active-low
- **bit 0 Unimplemented:** Read as ‘0’
1.6.7 PULL-UP RESISTOR
CONFIGURATION (GPPU)
REGISTER

The GPPU register controls the pull-up resistors for the PORT pins. If a bit is set and the corresponding pin is configured as an input, the corresponding PORT pin is internally pulled up with a 100 kΩ resistor.

REGISTER 1-7: GPPU – GPIO PULL-UP RESISTOR REGISTER (ADDR 0x06)

<table>
<thead>
<tr>
<th>bit 7</th>
<th>bit 0</th>

</tr>
</tbody>
</table>

Legend:

- **R** = Readable bit
- **W** = Writable bit
- **U** = Unimplemented bit, read as ‘0’
- **-n** = Value at POR
- ‘1’ = Bit is set
- ‘0’ = Bit is cleared
- **x** = Bit is unknown

bit 7-0 **PU7:PU0**: These bits control the weak pull-up resistors on each pin (when configured as an input) [7:0]

1 = Pull-up enabled
0 = Pull-up disabled
1.6.8 INTERRUPT FLAG (INTF) REGISTER

The INTF register reflects the interrupt condition on the PORT pins of any pin that is enabled for interrupts via the GPINTEN register. A ‘set’ bit indicates that the associated pin caused the interrupt.

This register is ‘read-only’. Writes to this register will be ignored.

Note: INTF will always reflect the pin(s) that have an interrupt condition. For example, one pin causes an interrupt to occur and is captured in INTCAP and INF. If before clearing the interrupt another pin changes, which would normally cause an interrupt, it will be reflected in INTF, but not INTCAP.

REGISTER 1-8: INTF – INTERRUPT FLAG REGISTER (ADDR 0x07)

<table>
<thead>
<tr>
<th>bit 7-0</th>
<th>INT7:INT0: These bits reflect the interrupt condition on the port. Will reflect the change only if interrupts are enabled (GPINTEN) [7:0].</th>
</tr>
</thead>
<tbody>
<tr>

<td>INT7: 1 = Pin caused interrupt, 0 = Interrupt not pending</td>
</tr>
<tr>
<td>bit 0</td>
<td>INT0: 1 = Pin caused interrupt, 0 = Interrupt not pending</td>
</tr>
</tbody>
</table>
1.6.9 INTERRUPT CAPTURE (INTCAP) REGISTER

The INTCAP register captures the GPIO port value at the time the interrupt occurred. The register is ‘read-only’ and is updated only when an interrupt occurs. The register will remain unchanged until the interrupt is cleared via a read of INTCAP or GPIO.

REGISTER 1-9: INTCAP – INTERRUPT CAPTURED VALUE FOR PORT REGISTER (ADDR 0x08)

- ‘1’ = Bit is set
- ‘0’ = Bit is cleared
- \( x \) = Bit is unknown

bit 7-0 ICP7:ICP0: These bits reflect the logic level on the PORT pins at the time of interrupt due to pin change [7:0]

\( 1 \) = Logic-high
\( 0 \) = Logic-low
1.6.10 PORT (GPIO) REGISTER

The GPIO register reflects the value on the port. Reading from this register reads the port. Writing to this register modifies the Output Latch (OLAT) register.

REGISTER 1-10: GPIO – GENERAL PURPOSE I/O PORT REGISTER (ADDR 0x09)

1 = Logic-high
0 = Logic-low
1.6.11 OUTPUT LATCH REGISTER (OLAT)

The OLAT register provides access to the output latches. A read from this register results in a read of the OLAT and not the port itself. A write to this register modifies the output latches that modify the pins configured as outputs.

REGISTER 1-11: OLAT – OUTPUT LATCH REGISTER 0 (ADDR 0x0A)

OL7:OL0: These bits reflect the logic level on the output latch [7:0]  

1 = Logic-high  
0 = Logic-low
1.7 Interrupt Logic

The interrupt output pin will activate if an internal interrupt occurs. The interrupt block is configured by the following registers:

- GPINTEN – enables the individual inputs
- DEFVAL – holds the values that are compared against the associated input port values
- INTCON – controls if the input values are compared against DEFVAL or the previous values on the port
- IOCON (ODR and INPOL) – configures the INT pin as push-pull, open-drain and active-level

Only pins configured as inputs can cause interrupts. Pins configured as outputs have no affect on INT.

Interrupt activity on the port will cause the port value to be captured and copied into INTCAP. The interrupt will remain active until the INTCAP or GPIO register is read. Writing to these registers will not affect the interrupt.

The first interrupt event will cause the port contents to be copied into the INTCAP register. Subsequent interrupt conditions on the port will not cause an interrupt to occur as long as the interrupt is not cleared by a read of INTCAP or GPIO.

1.7.1 INTERRUPT CONDITIONS

There are two possible configurations to cause interrupts (configured via INTCON):

1. Pins configured for interrupt-on-pin-change will cause an interrupt to occur if a pin changes to the opposite state. The default state is reset after an interrupt occurs. For example, an interrupt occurs by an input changing from ‘1’ to ‘0’. The new initial state for the pin is a logic ‘0’.

2. Pins configured for interrupt-on-change from register value will cause an interrupt to occur if the corresponding input pin differs from the register bit. The interrupt condition will remain as long as the condition exists, regardless if the INTAP or GPIO is read.

See Figure 1-6 and Figure 1-7 for more information on interrupt operations.

FIGURE 1-6: INTERRUPT-ON-PIN-CHANGE

FIGURE 1-7: INTERRUPT-ON-CHANGE FROM REGISTER DEFAULT
2.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Ambient temperature under bias.............................................................................................................-40°C to +125°C
Storage temperature .................................................................................................................................-65°C to +150°C
Voltage on VDD with respect to VSS ............................................................................................................... -0.3V to +5.5V
Voltage on all other pins with respect to VSS (except VDD)...................................................................... -0.6V to (VDD + 0.6V)
Total power dissipation (Note) ..................................................................................................................... 700 mW
Maximum current out of VSS pin ...................................................................................................................... 150 mA
Maximum current into VDD pin ...................................................................................................................... 125 mA
Input clamp current, IIK (VI < 0 or VI > VDD)............................................................................................ ±20 mA
Output clamp current, IOK (VO < 0 or VO > VDD)........................................................................................ ±20 mA
Maximum output current sunk by any output pin .......................................................................................... 25 mA
Maximum output current sourced by any output pin ....................................................................................... 25 mA

Note: Power dissipation is calculated as follows:

\[ P_{DIS} = V_{DD} \times (I_{DD} - \sum IOH) + \sum (V_{DD} - VOH) \times IOH + \sum (VOL \times IOL) \]

† NOTICE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
2.1 DC Characteristics

Operating Conditions (unless otherwise indicated):
1.8V ≤ VDD ≤ 5.5V at -40°C ≤ TA ≤ +85°C (I-Temp)
4.5V ≤ VDD ≤ 5.5V at -40°C ≤ TA ≤ +125°C (E-Temp) (Note 1)

3.0 PACKAGING INFORMATION

3.1 Package Marking Information

18-Lead PDIP (300 mil)

Example:

Example:

18-Lead SOIC (300 mil)

Example:

Example:

20-Lead QFN

Example:

Example:

20-Lead SSOP

Example:

Example:

Legend:  
XX...X Customer-specific information  
Y Year code (last digit of calendar year)  
YY Year code (last 2 digits of calendar year)  
WW Week code (week of January 1 is week ‘01’)  
NNN Alphanumeric traceability code  
* This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.
18-Lead Plastic Dual In-Line (P) – 300 mil Body [PDIP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

APPENDIX A: REVISION HISTORY

Revision F (March 2019)
The following is the list of modifications:
1. Updated the QFN package drawing in Section 3.0 “Packaging Information”.
2. Updated Section 3.0 “Packaging Information”.
3. Minor typographical edits.

Revision E (August 2007)
1. Section 3.0 “Packaging Information”: Updated package outline drawings.

Revision D (February 2007)
The following is the list of modifications:
1. Changed Byte and Sequential Read in Figure 1-1 from “R” to “W”.
2. Table 2-4, Param No. 51 and 53: Changed from 450 to 600 and 500 to 600, respectively.
3. Added disclaimer to package outline drawings.
4. Updated package outline drawings.

Revision C (October 2006)
The following is the list of modifications:
2. Added disclaimer to package outline drawings.

Revision B (February 2005)
The following is the list of modifications:
1. Section 1.6 “Configuration and Control Registers”. Added Hardware Address Enable (HAEN) bit to Table 1-3.
2. Section 1.6.6 “Configuration (IOCON) Register”. Added Hardware Address Enable (HAEN) bit to Register 1-6.

Revision A (December 2004)
Original Release of this Document.
MCP23008/MCP23S08

11. e) MCP23S08T-E/SS: Tape and Reel, Extended Temperature, 20LD SSOP package
12. f) MCP23S08T-E/ML: Extended Temperature, 20LD QFN package
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
