MIC2205

2 MHz PWM Synchronous Buck Regulator with LDO Standby Mode

Feature

• 2.7 to 5.5V Supply Voltage
• Light Load LDO Mode
  - 18 μA Quiescent Current
  - Low Noise, 75 μV_{RMS}
• 2 MHz PWM Mode
  - Output Current to 600 mA
  - >95% Efficiency
  - 100% Maximum Duty Cycle
• Adjustable Output Voltage Option Down to 1V
  - Fixed Output Voltage Options Available
• Ultra-Fast Transient Response
• Stable with 1 μF Ceramic Output Capacitor
• Fully Integrated MOSFET Switches
• Micropower Shutdown
• Thermal Shutdown and Current Limit Protection
• Pb-Free 3 mm x 3 mm VDFN Package
• –40°C to +125°C Junction Temperature Range

Applications

• Cellular Phones
• PDAs
• USB Peripherals

General Description

The MIC2205 is a high efficiency 2 MHz PWM synchronous buck (step-down) regulator that features an LDO standby mode that draws only 18 μA of quiescent current. The MIC2205 allows an ultra-low noise, small size, and high efficiency solution for portable power applications.

In PWM mode, the MIC2205 operates with a constant frequency 2 MHz PWM control. Under light load conditions, such as in system sleep or standby modes, the PWM switching operation can be disabled to reduce switching losses. In this light load mode, the LDO maintains the output voltage and draws only 18 μA of quiescent current. The LDO mode of operation saves battery life while not introducing spurious noise and high ripple as experienced with pulse skipping or bursting mode regulators.

The MIC2205 operates from 2.7V to 5.5V input and features internal power MOSFETs that can supply up to 600 mA output current in PWM mode. It can operate with a maximum duty cycle of 100% for use in low dropout conditions.

The MIC2205 is available in a 3 mm x 3 mm VDFN-10L package with an operating junction temperature range from –40°C to +125°C.

Package Type
Functional Block Diagram

Typical Application
1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Supply Voltage (V_IN) ................................................................. +6V
Output Switch Voltage (V_SW) .................................................... +6V
Output Switch Current (I_SW) ...................................................... 2A
Logic Input Voltage (V_EN, V_LOWQ) ........................................ –0.3V to V_IN
Storage Temperature (T_S) ....................................................... –60°C to +150°C
ESD Rating (Note 1) ................................................................. 3 kV

Operating Ratings ‡

Supply Voltage (V_IN) ................................................................. +2.7V to +5.5V
Logic Input Voltage (V_EN, V_LOWQ) ........................................ –0.3V to V_IN
Junction Temperature (T_J) ....................................................... –40°C to +125°C
Package Thermal Resistance VDFN-10 (θJA) ........................... 60°C/W

† Notice: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability. Specifications are for packaged product only.

‡ Notice: The device is not guaranteed to function outside its operating ratings.

Note 1: Devices are ESD sensitive. Handling precautions recommended. Human body model: 1.5 kΩ in series with 100 pF.

ELECTRICAL CHARACTERISTICS (Note 2)

Electrical Characteristics: V_IN = V_EN = V_LOWQ = 3.6V; L = 2.2 μH; T_A = 25°C; Bold values indicate –40°C ≤ T_A ≤ +125°C; unless otherwise noted.

**Note 1:** Dropout voltage is defined as the input-to-output differential at which the output voltage drops 2% below its nominal value that is initially measured at a 1V differential. For outputs below 2.7V, the dropout voltage is the input-to-output voltage differential with a minimum input voltage of 2.7V.

**Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., $T_A$, $T_J$, $\theta_{JA}$). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.

4.0 FUNCTIONAL DESCRIPTION

4.1 VIN
VIN provides power to the MOSFETs for the switch mode regulator section, along with the current limiting sensing. Due to the high switching speeds, a 1 μF capacitor is recommended close to VIN and the power ground (PGND) pin for bypassing.

4.2 AVIN
Analog VIN (AVIN) provides power to the LDO section and the bias through an internal 6Ω resistor. AVIN and VIN must be tied together. Careful layout should be considered to ensure high frequency switching noise caused by VIN is reduced before reaching AVIN.

4.3 LDO
The LDO pin is the output of the linear regulator and should be connected to the output. In LOWQ mode (LOWQ < 1.5V), the LDO provides the output voltage. In PWM mode (LOWQ > 1.5V) the LDO pin is high impedance.

4.4 EN
The enable pin provides a logic level control of the output. In the off state, supply current of the device is greatly reduced (typically <1 μA). Also, in the off state, the output drive is placed in a tri-stated condition, where both the high side P-channel MOSFET and the low-side N-channel are in an off or non-conducting state. Do not drive the enable pin above the supply voltage.

4.5 LOWQ
The LOWQ pin provides a logic level control between the internal PWM mode and the low noise linear regulator mode. With LOWQ pulled low (<0.5V), quiescent current of the device is greatly reduced by switching to a low noise linear regulator mode that has a typical IQ of 18 μA. In linear (LDO) mode the output can deliver 60 mA of current to the output. By placing LOWQ high (>1.5V), this transitions the device into a constant frequency PWM buck regulator mode. This allows the device the ability to efficiently deliver up to 600 mA of output current at the same output voltage.

4.6 BIAS
The BIAS pin supplies the power to the internal power to the control and reference circuitry. The bias is powered from AVIN through an internal 6Ω resistor. A small 0.1 μF capacitor is recommended for bypassing.

4.7 FB
The feedback pin (FB) provides the control path to control the output. For adjustable versions, a resistor divider connecting the feedback to the output is used to adjust the desired output voltage. The output voltage is calculated as shown in Equation 4-1.

**EQUATION 4-1:**

\[ V_{OUT} = V_{REF} \times \left( \frac{R_1}{R_2} + 1 \right) \]

Where:

\[ V_{REF} = 1.0V \]

A feed-forward capacitor is recommended for most designs using the adjustable output voltage option. To reduce battery current draw, a 100 kΩ feedback resistor is recommended from the output to the FB pin (R1). Also, a feed-forward capacitor should be connected between the output and feedback (across R1). The large resistor value and the parasitic capacitance of the FB pin can cause a high frequency pole that can reduce the overall system phase margin. By placing a feed-forward capacitor, these effects can be significantly reduced. Feed-forward capacitance (C_FF) can be calculated as shown in Equation 4-2.

**EQUATION 4-2:**

\[ C_{FF} = \frac{1}{2 \pi R_1 \times 160kHz} \]

For fixed options a feed-forward capacitor from the output to the FB pin is required. Typically a 100 pF small ceramic capacitor is recommended.

4.8 SW
The switch (SW) pin connects directly to the inductor and provides the switching current necessary to operate in PWM mode. Due to the high speed switching on this pin, the switch node should be routed away from sensitive nodes and it should be as small as possible.
4.9 PGND

Power ground (PGND) is the ground path for the high current PWM mode. The current loop for the power ground should be as small as possible and separate from the Analog ground (AGND) loop.

4.10 SGND

Signal ground (SGND) is the ground path for the biasing and control circuitry. The current loop for the signal ground should be separate from the Power ground (PGND) loop.
The MIC2205 is a 600 mA PWM power supply that utilizes a LOWQ light load mode to maximize battery efficiency in light load conditions. This is achieved with a LOWQ control pin that when pulled low, shuts down all the biasing and drive current for the PWM regulator, drawing only 18 μA of operating current. This allows the output to be regulated through the LDO output, capable of providing 60 mA of output current. This method has the advantage of producing a clean, low current, ultra low noise output in LOWQ mode. During LOWQ mode, the SW node becomes high impedance, blocking current flow. Other methods of reducing quiescent current, such as pulse frequency modulation (PFM) or bursting techniques, create large amplitude, low frequency ripple voltages that can be detrimental to system operation.

When more than 60 mA is required, the LOWQ pin can be forced high, causing the MIC2205 to enter PWM mode. In this case, the LDO output makes a hand-off to the PWM regulator with virtually no variation in output voltage. The LDO output then turns off allowing up to 600 mA of current to be efficiently supplied through the PWM output to the load.

5.1 Input Capacitor
A minimum 1 μF ceramic is recommended on the VIN pin for bypassing. X5R or X7R dielectrics are recommended for the input capacitor. Y5V dielectrics lose most of their capacitance over temperature and are therefore, not recommended.

A minimum 1 μF is recommended close to the VIN and PGND pins for high frequency filtering. Smaller case size capacitors are recommended due to their lower ESR and ESL.

5.2 Output Capacitor
Even though the MIC2205 is optimized for a 2.2 μF output capacitor, output capacitance can be varied from 1 μF to 4.7 μF. The MIC2205 utilizes type III internal compensation and utilizes an internal high frequency zero to compensate for the double pole roll off of the LC filter. For this reason, larger output capacitors can create instabilities. X5R or X7R dielectrics are recommended for the output capacitor. Y5V dielectrics lose most of their capacitance over temperature and are therefore, not recommended.

In addition to a 2.2 μF, a small 10 nF is recommended close to the load for high frequency filtering. Smaller case size capacitors are recommended due to their lower ESR and ESL.

5.3 Inductor Selection
The MIC2205 is designed for use with a 2.2 μH inductor. Proper selection should ensure the inductor can handle the maximum average and peak currents required by the load. Maximum current ratings of the inductor are generally given in two methods: permissible DC current and saturation current. Permissible DC current can be rated either for a 40°C temperature rise or a 10% to 20% loss in inductance. Ensure that the inductor selected can handle the maximum operating current. When saturation current is specified, make sure that there is enough margin that the peak current will not saturate the inductor. Peak inductor current can be calculated as shown in Equation 5-1.

**EQUATION 5-1:**

\[ I_{PK} = I_{OUT} \left( 1 - \frac{V_{OUT}}{V_{IN}} \right) + \frac{V_{OUT}}{2 \times f \times L} \]

#### Package:
- ML = 10-Lead 3 mm x 3 mm x 0.9 mm VDFN

#### Media Type:
- TR = 5,000/Reel

**Note:** Other voltage options available. Contact your Microchip Sales Office.

### Examples:

- **a) MIC2205YML-TR:** 2 MHz PWM Synchronous Buck Regulator with LDO Standby Mode, Adjustable Output Voltage, –40°C to +125°C Temp. Range, RoHS Compliant, 10-Lead 3 mm x 3 mm VDFN Package, 5000/Reel

- **b) MIC2205-1.3YML-TR:** 2 MHz PWM Synchronous Buck Regulator with LDO Standby Mode, 1.3V Fixed Output Voltage, –40°C to +125°C Temp. Range, RoHS Compliant, 10-Lead 3 mm x 3 mm VDFN Package, 5000/Reel

- **c) MIC2205-1.38YML-TR:** 2 MHz PWM Synchronous Buck Regulator with LDO Standby Mode, 1.38V Fixed Output Voltage, –40°C to +125°C Temp. Range, RoHS Compliant, 10-Lead 3 mm x 3 mm VDFN Package, 5000/Reel

- **d) MIC2205-1.58YML-TR:** 2 MHz PWM Synchronous Buck Regulator with LDO Standby Mode, 1.58V Fixed Output Voltage, –40°C to +125°C Temp. Range, RoHS Compliant, 10-Lead 3 mm x 3 mm VDFN Package, 5000/Reel

- **e) MIC2205-1.8YML-TR:** 2 MHz PWM Synchronous Buck Regulator with LDO Standby Mode, 1.8V Fixed Output Voltage, –40°C to +125°C Temp. Range, RoHS Compliant, 10-Lead 3 mm x 3 mm VDFN Package, 5000/Reel

**Note 1:** Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

**Trademarks**

The Microchip name and logo, the Microchip logo, AnyRate, AVR, AVR logo, AVR Freaks, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KeeLoq, Kleer, LANcheck, LINK MD, maxStylus, maxTouch, MediaLB, megaAVR, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, Prochip Designer, QTouch, SAM-BA, SpyNIC, SST, SST Logo, SuperFlash, tinyAVR, UNI/O, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, EtherSynch, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and Quiet-Wire are registered trademarks of Microchip Technology Incorporated in the U.S.A.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
