The PIC18F26/45/46K40 family devices that you have received conform functionally to the current Device Data Sheet (DS40001816F), except for the anomalies described in this document.

The silicon issues discussed in the following pages are for silicon revisions with the Device and Revision IDs listed in Table 1. The silicon issues are summarized in Table 2.

The errata described in this document will be addressed in future revisions of the PIC18F26/45/46K40 silicon.

For example, to identify the silicon revision level using MPLAB IDE in conjunction with a hardware debugger:

1. Using the appropriate interface, connect the device to the hardware debugger.
2. Open an MPLAB IDE project.
3. Configure the MPLAB IDE project for the appropriate device and hardware debugger.
4. Based on the version of MPLAB IDE you are using, do one of the following:
   a) For MPLAB IDE 8, select Programmer > Reconnect.
   b) For MPLAB X IDE, select Window > Dashboard and click the Refresh Debug Tool Status icon ( ).
5. Depending on the development tool used, the part number and Device Revision ID value appear in the Output window.

The DEVREV values for the various PIC18F26/45/46K40 silicon revisions are shown in Table 1.

**Note:** If you are unable to extract the silicon revision level, please contact your local Microchip sales office for assistance.

Silicon Errata Issues

**Note:** This document summarizes all silicon errata issues from all revisions of silicon, previous as well as current. Only the issues indicated by the shaded column in the following tables apply to the current silicon revision (A4).

1. **Module: Analog-to-Digital Converter (ADC)**

   1.1 **ADC Conversion**

   When using the ADCRC as the clock source for ADCC, there is a delay of one instruction cycle between the user setting the ADGO bit and being able to read it set. This can lead to a false conversion complete scenario (i.e., ADGO being cleared), depending if the user code has a bit clear test (BTFSC instruction on the ADGO bit, immediately after setting the ADGO bit). See code example below.

   e.g.
   
   ```
   BSF ADCON0, ADGO ; Start conversion
   BTFSC ADCON0, ADGO ; Is conversion done?
   GOTO $-1 ; No, test again
   ```

   The BTFSC will pass the very first time in this situation.

   **Work around**

   Add a NOP instruction after setting the ADGO bit and before testing the bit for completion of conversion (see code example below).

   e.g.
   
   ```
   BSF ADCON0, ADGO ; Start conversion
   NOP
   BTFSC ADCON0, ADGO ; Is conversion done?
   GOTO $-1 ; No, test again
   ```

   **Affected Silicon Revisions**

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

1.2 **Computation Overflow Bit**

   If the sign bit of ADFLTR (bit 7 of ADFLTRH) is set, the Computation Overflow bit will also be set, even though this is not a legitimate case of an overflow event.

   **Work around**

   None.

   **Affected Silicon Revisions**

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

1.3 **ADCRC Oscillator Operation in Sleep**

   If the part is in Sleep and the ADCRC oscillator is used as the clock source to the ADC, the oscillator continues to run after the conversion is complete. This will increase the current consumption in Sleep mode. The oscillator will stop after the device exits Sleep mode and resumes normal code execution.

   **Work around**

   None.

   **Affected Silicon Revisions**

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

1.4 **ADC Conversion with FVR**

   Using the FVR as the positive voltage reference for the ADC can cause an increase in missing codes.

   **Work around**

   Increase the bit conversion time, known as TAD, to 8 µs or higher.

   **Affected Silicon Revisions**

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>
2. Module: PIC18 Debug Executive

2.1 Data Write Match Breakpoints

If the data in a GPR location is modified using any arithmetic instruction like INCF, ADDWF, SETF, CLRFR, etc., the data write match breakpoint does not work. It works with MOVF, which moves the data into the same memory location.

e.g.

1. 
MOVLB 0x00
CLRF 0x08
LOOP
INCF 0x08 ;Doesn’t break when data breakpoint set @ 0x08 with data match for 0xAA
GOTO LOOP
2.
MOVLB 0x00
MOVLW 0xAA
MOVF 0x08 ;Breaks when data breakpoint set @ 0x08 with data match for 0xAA

Work around

Use data write breakpoints without matching wherever possible.

Affected Silicon Revisions

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

3. Module: PIC18 Core

3.1 TBLRD Requires NVMREG Value to Point to Appropriate Memory

The affected silicon revisions of the PIC18FXXK40 devices improperly require the NVMREG<1:0> bits in the NVMCON register to be set for TBLRD access of the various memory regions. The issue is most apparent in compiled C programs when the user defines a CONST type and the compiler uses TBLRD instructions to retrieve the data from program Flash memory (PFM). The issue is also apparent when the user defines an array in RAM for which the compiler creates start-up code, executed before main(), that uses TBLRD instructions to initialize RAM from PFM.

Work around

Assembly code:

Set the NVMREG<1:0> bits to select the appropriate memory region before executing TBLRD instructions.

C code:

Create an assembly file named powerup.as and include this file with the other files in the project. This file will change the NVMREG<1:0> bits to point to program Flash before any code is executed.

Contents of the powerup.as file:

```c
#include <xc.inc>
GLOBAL powerup, start
PSECT powerup, class=CODE, delta=1, reloc=2
powerup:
    BSF NVMCON1, 7
    GOTO NVMCON1, 7
start
end
```

If there is a need to change the NVMREG<1:0> value to anything other than ‘10’ and the Interrupt Service Routine uses constants or literal strings, then interrupts must be disabled before the change and restored to ‘10’ before interrupts are enabled.

Affected Silicon Revisions

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>
4. Module: Program Flash Memory

4.1 Endurance of PFM is Lower than Specified

The Flash memory cell endurance specification (Parameter MEM30) is 1K cycles.

Work around
None.

Affected Silicon Revisions

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

5. Module: MSSP

5.1 SMBus 2.0 Voltage Level

The input low-voltage threshold level (VIL) depends on VDD, as follows:

- VIL = 0.7 for VDD < 4V
- VIL = 0.8 for VDD > 4V

Work around
None.

Affected Silicon Revisions

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

6. Module: Electrical Specifications for LF Devices Only

6.1 Min VDD Specification

VDDMIN specifications are changed for LF devices only.

- VDDMIN at -40°C to 0°C = 2.3V
- VDDMIN at 0°C to 25°C = 2.1V

Work around
None.

Affected Silicon Revisions

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

7. Module: Electrical Specifications

7.1 Fixed Voltage Reference (FVR)

At temperatures below -20°C, the output voltage for the FVR may be greater than the levels specified in the data sheet. This will apply to all three gain amplifier settings, (1X, 2X, 4X). The affected parameter numbers found in the data sheet are: FVR01 (1X gain setting), FVR02 (2X gain setting), and FVR03 (4X gain setting).

Work around
At temperatures above -20°C, the stated tolerances in the data sheet remain in effect. Operate the FVR only at temperatures above -20°C.

Affected Silicon Revisions

<table>
<thead>
<tr>
<th>A3</th>
<th>A4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

8. Module: Timer0

8.1 Clock Source

Clearing the T0ASYNC bit in the T0CON1 register when Timer0 is configured to use Fosc/4 may cause incorrect behavior.

This issue is only valid when Fosc/4 is used as the clock source.

Work around
Set the T0ASYNC bit in the T0CON1 register when using Fosc/4 as the Timer0 clock.

Data Sheet Clarifications

The following typographic corrections and clarifications are to be noted for the latest version of the device data sheet (DS40001816F).

**Note:** Corrections are shown in **bold**. Where possible, the original bold text formatting has been removed for clarity.

1. Module: Core Features

1.1 Operating Speed on Pg.1

The bullet point mentioning the operating speed is incorrect. The correct text is shown below.

- Operating Speed:
  - **DC-64 MHz clock input**
  - 62.5 ns minimum instruction cycle
APPENDIX A: DOCUMENT
REVISION HISTORY

Rev A Document (09/2016)
Initial release of this document.

Rev B Document (12/2016)
Added silicon revision A4; added 1.3, 1.4 and 5.1 modules; other minor corrections.

Added Module 6 to Silicon Errata Issues; other minor corrections.

Data Sheet Clarifications: Added Module 1: Pin Diagrams.

Added Module 7: Electrical Specifications (FVR) and Module 8: Timer0.
Data Sheet Clarifications: Removed updated data sheet items. Added Module 1 (Core Features).
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
