ASF: Release ASF-3.15

The Atmel® Software Framework (ASF, www.atmel.com/asf) is a compilation of embedded software for Atmel flash MCUs: megaAVR®, AVR XMEGA®, AVR UC3 and SAM devices. It has been designed to help develop and glue together the different components of a software design. It can easily integrate into an operating system (OS) or run as a stand-alone product.

The ASF is included in Atmel Studio® 6 (www.atmel.com/atmelstudio). A separate package is available for megaAVR, AVR XMEGA, AVR UC3 and SAM users for IAR™, Atmel AVR Studio 4 and AVR32 Studio on www.atmel.com/asf. Atmel Studio users do not need this package as the ASF is integrated in Atmel Studio.

This document describes the supported devices, supported tools, and changes since last ASF release (enhancements, bugs fixes and known issues).

**Issue #ASFP-4311:** Multiple issues in SAM FreeRTOS TWI service.

Fixed the following bugs in FreeRTOS TWI master driver:
* Do not use PDC for reads less than 3 bytes
* Set stop bit at same time as start bit for reads of 1 byte
* When stop PDC transfer when slave nacks address
* Do not send stop when slave sends NACK - handled by hardware
* Do not release semaphore before txcomp flag is set
* Added support to use the driver without internal addressing

**Issue #ASFP-4312:** SAM twi_master_read does not handle packet lengths of 1 correctly.

Updated driver to send STOP condition as specified in datasheet.

**Issue #ASFP-4356:** Change default BOD level setting in SAM D20 BOD driver.

SAM D20 BOD driver uses 0x12 as default level for BOD33 using get_config_defaults() function. But the latest datasheet does not shows up any threshold voltage level corresponding to 0x12 but for other values. Fix the driver to use default value from anyone of the available values from datasheet.

Known issues

- **Issue #ASFP-184**: AT42QT1060 driver - use of EIC hardcoded for EVK1105 only. AT42QT1060 component is not supported by the AT32UC3A0 and AT32UC3A1 device family.

- **Issue #ASFP-198**: PolarSSL needs to be updated to version 1.0.0 to solve build error. Header file "openssl.h" from polarssl version 0.14.0 has some wrong function definition that creates build error. Update to version 0.99 will solve the issue

- **Issue #ASFP-674**: common/components/memory/data_flash/at45dbx is not listed for any devices in AVR Studio 5 ASF menu. Some AT45DBX definitions are missing in board definition causing module errors when using it in AVR Studio 5 with those boards. Modified file : avr32/boards/uc3_a3_xplained/uc3_a3_xplained.h ,xmega/boards/xmega_a1_xplained/xmega_a1_xplained.h

- **Issue #ASFP-881**: XMEGA NVM driver does not support XMEGA A3 rev B errata.

- **Issue #ASFP-882**: Sensor library fails compilation if not using a board in the 'Xplained' series of boards.

- **Issue #ASFP-3595**: ASF includes its own SAM header files set which is not synchronized with the latest header files from Atmel Studio 6.1 toolchain. The Atmel Studio 6.1beta header files set for SAM devices is not backward compatible with the Atmel Studio 6.0 header files set. ASF SAM drivers are using their own set of header files (from sam/utils/cmsis/sam*/include) and are not compatible with the Atmel Studio 6.1beta header files. SAM drivers will be ported to the new Atmel Studio 6.1beta header files set in a later ASF release.
