dsPIC30F Digital Signal Controllers
The Best of Both Worlds
April 2005
A Digital Signal Controller (DSC) is a single-chip, embedded controller that seamlessly integrates the control attributes of a Microcontroller (MCU) with the computation and throughput capabilities of a Digital Signal Processor (DSP) in a single core.

Microchip’s dsPIC® DSC offers everything you would expect from a powerful 16-bit MCU: fast, sophisticated and flexible interrupt handling; a wide array of digital and analog peripheral functions; power management; flexible clocking options; power-on-reset; brown-out protection; watchdog timer; code security; full-speed real-time emulation; and full-speed in-circuit debug solutions.

By skilfully adding DSP capability to a powerful 16-bit MCU, Microchip’s dsPIC30F family of dsPIC DSCs achieves the best of both worlds and marks the beginning of a new era in embedded control.

**What is a Digital Signal Controller?**

**Powerful 16-bit MCU:**

The dsPIC30F family of devices executes most of its instructions in 1 cycle (33 ns at 30 MIPS). Combine this high instruction throughput with true DSP capabilities, such as single cycle 16-bit multiply and zero overhead looping, and you have the most powerful 16-bit MCU at your command.

**Looking to Add DSP?**

If you are one of the many MCU users looking to add DSP features to your system, chances are you don’t like your choices. Adding a DSP chip to your existing MCU-based system can be costly and complicated. The dsPIC30F is designed to look and feel like an MCU. Adding DSP functionality in the familiar controller-like environment can be accomplished with ease.

**Reliable Flash:**

The dsPIC30F incorporates Microchip’s PEEL Flash process technology with data retention of 40+ years at 85° C, endurance of 1 million cycles typical at 85° C and fast programming time. There is no better Flash technology for embedded control.

Additionally, the dsPIC30F can securely self-program its own Flash memory in a finished product.

**DSP for the DSP Expert!**

A seasoned DSP developer will be amazed at the capabilities the dsPIC30F family offers — everything you expect from a DSP of its class: dual 40-bit accumulators, single-cycle 16 x 16 MAC, 40-bit barrel shifter, dual operand fetches, saturation and rounding modes and DO and REPEAT loops. Then we added a few items usually missing from DSPs: flexible interrupts, large register sets, a watchdog timer, clock fail detect and real-time emulation to name a few.

**Optimized C Compiler:**

The dsPIC30F architecture was co-developed by our MPLAB® C30 C Compiler team. The result is a high C code efficiency when compared to any 16-bit MCU or DSP.

C code benchmarks show that competitive 16-bit MCUs require up to double the amount of program code space for the same application program written in C.

**Considering a 32-bit MCU?**

Considering a 32-bit controller because your current MCU has run out of steam?

The dsPIC30F with integrated DSP can outperform a 32-bit controller in many applications. Our outstanding C code efficiency for 32-bit data type reduces memory requirements and cost.

Future dsPIC30F variants with larger program memory are in development to give you a long-term roadmap with the dsPIC DSC architecture.
Outstanding MCU Performance

The first 16-bit MCUs were developed to overcome the native 64 KB boundary imposed by 8-bit MCUs. The need for advanced performance was not contemplated in these early architectures. When the need for improved performance became obvious, next-generation devices were developed, but were constrained by backward compatibility requirements and legacy issues.

Developed from the ground up, the dsPIC DSC addresses traditional 16-bit requirements without sacrificing performance. It combines state-of-the-art 16-bit MCU performance in its general-purpose register-based core with all the features you need for DSP operations.

Bridging the Performance Gap

Microchip’s dsPIC30F places unprecedented performance in the hands of 16-bit MCU designers. The dsPIC DSC has the “heart” of a 16-bit MCU with robust peripherals and fast interrupt handling capability and the “brain” of a DSP that manages high computation activities, creating the optimum single-chip solution for embedded system designs. This enables you to add powerful new features to your product and integrate functions to save board space.

Competitive DSP Performance

The dsPIC30F balances its outstanding MCU qualities with competitive DSP performance. All the features you require from a high performance, robust DSP are effortlessly integrated in the dsPIC DSC.
### dsPIC30F Features Overview

#### Operating Range
- DC to 30 MIPS
- Wide Vdd range: 2.5 - 5.5V
- Ind.(-40° to 85° C) and ext. (-40° to 125°C)
- *30 MIPS @ 4.5-5.5V, -40° to 85° C

#### High Performance DSC CPU
- Single core combines MCU and DSP features
- C compiler optimized instruction set
- 16-bit wide data path
- 24-bit wide instructions
- 84 base instructions: mostly 1 word/1 cycle
- 16 16-bit general purpose registers
- 2 40-bit accumulators
- With rounding and saturation options
- Flexible and powerful addressing modes: Indirect, modulo and bit-reversed
- Software stack
- 16 x 16 fractional/integer multiplier
- 32/16 and 16/16 divide
- Single cycle multiply-and-accumulate
- 40-stage barrel shifter

#### Power Management
- Switch between clock sources in real-time
- Programmable power-on reset start up
- Programmable low-voltage detect
- Programmable brown-out reset
- Idle and Sleep modes with fast wake-up

#### Digital I/O
- Up to 54 programmable digital I/O pins
- Wake-up/Interrupt-on-change on up to 24 pins
- 25 mA sink and source on all I/O pins

#### On-Chip Flash, Data EEPROM and SRAM
- Flash program memory: up to 144 KB
- 100K erase/write cycles typical
- Data EEPROM: up to 4 KB
- 1 million erase/write cycles typical
- Data SRAM: up to 8K bytes

#### System Management
- Flexible clock options:
  - Primary external clock, crystal, resonator
  - Secondary external lower power (32 kHz crystal oscillator)
  - Internal RC: fast or low power
  - Integrated PLL (4x, 8x, 16x)
  - Low jitter PLL
  - PLL sourced by ext. & int. clock sources

- Programmable power-up timer
- Oscillator start-up timer/stabilizer
- Watchdog Timer with its own RC oscillator
- Clock switching/fail-safe clock monitor

#### Interrupt Controller
- 5 cycle fixed latency
- Up to 45 interrupt sources, up to 5 external
- 7 programmable priority levels

#### Timers/Capture/Compare/PWM
- Timer/counters: up to five 16-bit timers
- Can pair up to make 32-bit timers
- 1 timer runs as real-time clock with external 32 kHz oscillator
- Input capture: up to 8 channels
- Capture on rising, falling or both edges
- 4-deep FIFO on each capture
- Output compare: up to 8 channels
- Single or dual 16-bit compare mode
- 16-bit glitchless PWM mode

#### Communication Modules
- 3-wire SPI™: up to 2 modules
- Framing supports I/O interface to simple codecs
- PC™ full multi-master, slave mode support
- 7-bit and 10-bit addressing
- Bus collision detection and arbitration
- UART: up to 2 modules
- Interrupt-on-address bit detect
- Wake-up on Start bit from Sleep mode
- 4-character TX and RX FIFO buffers
- Codec interface module
- Supports IS and AC97™ protocols
- CAN 2.0B active: up to 2 modules
- 3 transmit and 2 receive buffers
- Wake-up on CAN message

#### Motor Control Peripherals
- Motor Control PWM: up to 8 outputs
- 4 duty cycle generators
- Independent or complementary mode
- Programmable dead time settings
- Edge or center-aligned
- Manual output override control
- Up to 2 fault inputs
- A/D samples triggered by PWM module
- Quadrature encoder interface module
- Phase A, Phase B and index pulse input

#### Analog-to-Digital Converters
- Enhanced!
- 10-bit, 1 Msps A/D converter module
- 2 or 4 simultaneous samples
- Up to 16 input channels with auto scanning
- 16 deep result buffer
- Conversion possible in Sleep mode
- 12-bit, 200 ksps A/D converter module
- Up to 16 input channels with auto scanning
- 16 deep result buffer
- Conversion possible in Sleep mode
- ±1 LSB accuracy
dsPIC30F Product Families

General Purpose Family
The dsPIC30F General Purpose Family is ideal for a wide variety of 16-bit MCU embedded applications. In addition, the variants with codec interfaces are well suited for audio applications.

Motor Control and Power Conversion Family
This dsPIC30F family supports motor control applications, such as brushless DC motors, single and 3-phase induction and switch reluctance motors. These are also ideal for UPS, inverters, switched mode power supplies and power factor correction.

dsPIC30F Packages

Images are approximately to scale.
Designed for real-time control, the dsPIC DSC offers outstanding reliability, robustness and reduced system cost.

**On-chip oscillator eliminates crystal, reduces cost**

The dsPIC DSC’s on-chip precision oscillator (FRC: 7.5 MHz, ±1.5% over VDD and temperature) can be the clock source for many systems. In several dsPIC DSCs, the PLL can boost the clock speed and still meet ±2% accuracy. Now you can eliminate the external crystal, save board space and reduce system cost.

**Power save modes optimizes power consumption**

The dsPIC DSC offers many ways to optimize power consumption. Switch to a low frequency on-chip oscillator or divide down the system clock during periods of inactivity. Go into “power-down” mode to shut down all clocks to reduce current draw to microamperes yet allow a quick wake-up on interrupt.

**25 mA I/O drive saves cost**

Each I/O pin sources or sinks 25 mA, making it possible to drive LEDs directly or eliminate pre-drivers for external FET switches to save you space and cost.

**Reliable watchdog timer**

Flash configuration bits are used to enable the watchdog timer and select its period. Software cannot disable it; as it runs from its own internal oscillator, independent of the system clock. Now that is a reliable watchdog.

**Self-monitoring CPU protects against software glitches**

Code execution flow is continually monitored to prevent catastrophic failures due to software malfunction. Accesses to non-existing memory locations are trapped, as are stack overflow, stack underflow and un-initialized pointer accesses. Unimplemented op codes execute as NOPs to avoid unpredictable behavior. Now your real-time system has an added level of safety.

**Low Jitter PLL for reliable system operation**

On-chip PLL with crystal oscillator input offers low jitter, < ±0.75% over VDD and temperature for reliable operation of CAN or other forms of communication.

**125° ambient operation**

All dsPIC DSCs operate up to 125°C ambient temperature, making these ideal for industrial applications that run “hot” such as motor control, power conversion, lighting control as well as “under the hood” automotive systems such as EHPS, electronic gearbox, cooling fan control, etc.

**Small package – big performance**

Several dsPIC DSCs come in QFN packages as small as 6 x 6 mm or 8 x 8 mm and only 0.9 mm high. Now you add 16-bit performance in the tiniest of places.

**Power-on Reset and Brown-out Reset add robustness, saves cost**

Intelligent on-chip Power-on Reset eliminates external reset circuit in most systems. Vary the reset period to allow for different crystal start-up delays. Brown-out protection, if enabled, resets the chip in the event of a power glitch. All this adds up to a robust system at a reduced cost.

**125° ambient operation**

All dsPIC DSCs operate up to 125°C ambient temperature, making these ideal for industrial applications that run “hot” such as motor control, power conversion, lighting control as well as “under the hood” automotive systems such as EHPS, electronic gearbox, cooling fan control, etc.

**25 mA I/O drive saves cost**

Each I/O pin sources or sinks 25 mA, making it possible to drive LEDs directly or eliminate pre-drivers for external FET switches to save you space and cost.

**Reliable watchdog timer**

Flash configuration bits are used to enable the watchdog timer and select its period. Software cannot disable it; as it runs from its own internal oscillator, independent of the system clock. Now that is a reliable watchdog.

**On-chip system clock monitor adds safety**

The dsPIC DSC’s on-chip clock monitor detects system clock failure and forces a chip-reset. Restarting the system with the on-chip oscillator (FRC) provides a graceful way to handle such a catastrophic failure.

**Power save modes optimizes power consumption**

The dsPIC DSC offers many ways to optimize power consumption. Switch to a low frequency on-chip oscillator or divide down the system clock during periods of inactivity. Go into “power-down” mode to shut down all clocks to reduce current draw to microamperes yet allow a quick wake-up on interrupt.

**Low Jitter PLL for reliable system operation**

On-chip PLL with crystal oscillator input offers low jitter, < ±0.75% over VDD and temperature for reliable operation of CAN or other forms of communication.

**Small package – big performance**

Several dsPIC DSCs come in QFN packages as small as 6 x 6 mm or 8 x 8 mm and only 0.9 mm high. Now you add 16-bit performance in the tiniest of places.

**Power-on Reset and Brown-out Reset add robustness, saves cost**

Intelligent on-chip Power-on Reset eliminates external reset circuit in most systems. Vary the reset period to allow for different crystal start-up delays. Brown-out protection, if enabled, resets the chip in the event of a power glitch. All this adds up to a robust system at a reduced cost.
One Architecture, Many Solutions

The versatile dsPIC30F family provides solutions for embedded control applications and offers a wide variety of digital and analog peripheral modules. Choose a high pin count, high-density memory dsPIC30F device as a main controller in a large, complex embedded system. Or select a small pin count, small package device to tackle a single motor or a sensor. No other 16-bit MCU or DSP family gives you so much flexibility.

Invest in the dsPIC30F family once and reap the benefits of having a single platform over many applications.

Motor Control

The dsPIC30F is ideal for motors requiring more than a basic microcontroller. Whether you need a little more computation power or full DSP capability, the dsPIC30F delivers.

Apply the dsPIC30F for sensorless control, precision speed/position/servo control, torque management, variable speed motors, high RPM motors, variable load applications, noise reduction or energy efficiency improvement. Brushless DC, AC induction or switch reluctance motors are ideal candidates for the dsPIC30F family of controllers.

Applications:

- Heating, ventilation and air conditioning
- Absolute encoders and resolvers
- Blowers and lawn equipment
- Electronic Power Steering
- Industrial gate openers
- Seat belt tensioners
- Exercise equipment
- Washing machines
- Sewing machines
- Industrial pumps
- Stability control
- Power tools
- Refrigeration
- Printing machines

Enabling Features of the dsPIC30F:

- 1 or 2 fault pins
- 28-, 40-, 64- and 80-pin variants
- 6 or 8 motor PWM output
- Complementary or independent PWM
- Center-aligned or edge-aligned PWM
- A/D sampling synchronized to PWM cycle
- 10-bit, 1 Msps A/D converter
- 2 or 4 simultaneous A/D samples
- 5V native operation for noisy environments
- On-chip Quadrature Encoder Interface (QEI)
- Motor control algorithm reference designs
- Up to 2 programmable dead time settings

Internet Connectivity

If your embedded control system needs to be connected to the Internet or to a dial-up phone line, the dsPIC30F provides you with a single chip solution. The “ready-to-use” TCP/IP Ethernet driver and soft modem application libraries enable you to add connectivity to your design.

Applications:

- Remote diagnostics of industrial equipment
- Remote medical equipment
- Water, gas and electric meters
- Industrial gate openers
- Remote monitoring
- Vending machines
- Power line modems
- Security systems
- Set top boxes
- Internet speakers

Enabling Features of the dsPIC30F:

- UART interface
- TCP/IP Software Library
- Soft Modem Library (V.32bis/V.22bis)
- Encryption libraries
- Ethernet driver software
- RTOS for multitasking
- Reduced board space
- Reduced total system cost
Sensor Control

The 18- and 28-pin small footprint dsPIC30F parts are ideal for advanced sensor control. The combination of a 12-bit A/D converter, communication peripherals, power management features and DSP capability makes it possible to create intelligent sensor interface modules. These devices can also assist an overloaded central controller.

Applications:

- Advanced 2-D PIR detection
- Chemical and gas sensors
- Glass break detectors
- Gyroscopic modules
- Knock detection
- Vibration sensors
- Pressure sensors
- Torque sensors
- Coin acceptors
- Magnetic sensors
- Ultrasonic sensors

Enabling Features of the dsPIC30F:

- Data EEPROM
- DSP capability
- High speed input capture
- Small footprint 18- or 28-pin packages
- 12-bit, 200 ksps A/D converter
- SPI™, I²C™ and UART communication ports
- Visual digital filter design tool
- Configurable Flash memory can update algorithms

Automotive

Microchip is an ISO/TS 16949:2002 qualified supplier to major automotive manufacturers. Most of our products are available for automotive-grade temperature requirements and support a long product life cycle.

Available in 18- to 80-pin packages, the dsPIC30F family is ideal for a variety of automotive applications from a large central controller to small sensor interface or peripheral processor.

Applications:

- Electrically assisted hydraulic steering
- Electronic clutch and gearboxes
- Roll and stability controllers
- Seat belt pretensioners
- Electronic power steering
- Cabin noise cancellation
- Advanced battery monitors
- Airbag main controllers
- Ignition controllers
- Side impact airbags
- Occupant sensors
- Fuel pressure controls

Enabling Features of the dsPIC30F:

- DSP capability
- Powerful MCU core
- CAN and OSEK Library
- 18- to 80-pin products
- One or two CAN 2.0B modules
- Long product life cycle supported
- Broad product selection for many applications
- Extended temperature operation
- VDD range of +2.5 to 5.5V DC
- LIN support through UART and software
- Safe mode operation features: LVD, BOR, WDT, software traps
- High reliability Flash with typical endurance of one million erase/write cycles and data retention of >40 years
Speech

Often speech and low fidelity audio applications use a DSP for algorithm processing and an MCU for control. The dsPIC30F can replace both in many applications and reduce total system cost. The dsPIC DSC provides enough MIPS for many speech and audio applications, such as noise and echo cancellation, speech recognition and quality speech compression and playback.

The dsPIC DSC is also an ideal companion to a main DSP in high-end audio applications; offloading functions such as a digital tuner, satellite radio, equalizer, etc.

Power Conversion and Monitoring

The dsPIC30F is ideal for a variety of power conversion and monitoring applications. UPSs, inverters, as well as power management units within complex equipment, such as copiers, telecom switches and routers, require advanced power management. The dsPIC30F has Pulse Width Modulation (PWM) outputs, fast analog-to-digital conversion and plenty of computation power to satisfy the needs of these applications.

Powerful Tools and Libraries to Ease Your Development

The dsPIC30F family comes with an extensive array of development tools, application libraries (many of which are free of charge), development boards and reference designs that allow high-performance embedded solutions to be designed effortlessly and rapidly.

**MPLAB® Integrated Development Environment (IDE)**

All dsPIC30F tools operate effortlessly under the MPLAB IDE umbrella. The powerful and yet easy-to-use MPLAB IDE has all of the advanced edit/build/debug features you would expect from a 32-bit debug environment. MPLAB IDE integrates not only software, but all of Microchip’s hardware tools and many third party tools. Key features of MPLAB IDE:

- Designed for Windows® XP, 2000 and Windows NT®
- Project build and management
- Flexible watch windows
- Mouse over variable inspection
- Full feature code editor with color context
- Source level debug in ASM and C
- Searchable trace buffers
- Version control integration

Microchip is committed to making your development as easy and efficient as possible. This commitment is the reason why Microchip develops its own software and hardware tools. You have our full technical support whether the issue is silicon or tools-related.

The dsPIC30F development tools suite provides value with many free and low-cost tools. You can get started with the MPLAB ICD 2 In-Circuit Debugger and the MPLAB IDE for approximately US $160.

If you already own a PRO MATE® II, the dsPIC30F family is supported on it. If you are considering a new full-featured programmer, the MPLAB PM3 is recommended.

dsPICworks™ Data Analysis and DSP Software

The dsPICworks Data Analysis and DSP Software makes it easy to evaluate and analyze DSP algorithms. You can run a variety of DSP and arithmetic operations and analyze your data in both time and frequency domain. Key features of the dsPICworks Data Analysis and DSP Software:

- Visually analyze time and frequency domain data
- DSP operations: FFT, convolution, correlation, DCT and filtering
- Waveform synthesis
- Tool generates one-, two- and three-dimensional frequency graphs
- Data import/export options to interface with MPLAB IDE and MPLAB ASM30
- Support for fractional, integer and IEEE floating point data in decimal and hexadecimal notation

Digital Filter Design Tool

The Digital Filter Design Tool makes designing and analyzing FIR and IIR filters easy. Enter frequency specifications and filter code and coefficients are generated automatically. Graphical output windows provide the desired filter’s characteristics.

Digital Filter Design Lite Tool

Not ready to purchase the whole Digital Filter package? Why not start Lite? The Digital Filter Design Lite Tool includes most of the features of the full-featured version at a fraction of the cost.

Jump-start Your Design with Proven and Optimized Building Block Libraries

Math Library

This IEEE-754 compliant library provides single and double precision floating point ANSI C standard math functions. These routines have been optimized to provide the smallest code size. The library can be used in Assembly or C. Key functions in the Math Library:
- sin, cos, tan
- asin, acos, atan
- ln, log10, sqrt, pow
delt, floor, mod, frexp

DSP Algorithm Library

This extensive DSP building block library is fully optimized in Assembly code for execution speed. The DSP functions can be used in Assembly or C. Some key algorithms addressed in the DSP Algorithm Library:
- Cascaded IIR filters
- FIR filters and LMS filters
- Correlation, convolution
- FFT and window functions
- Matrix and vector operations

Peripheral Driver Library

This library of over 270 C utility functions helps you set up and operate the hardware peripheral modules in various modes. Functions covered in the Peripheral Driver Library:
- 10-bit and 12-bit A/D converters
- UART, SPI™, I²C™ and codec interface
- Motor Control PWM and QEI
- General purpose timers
- Input capture and output compare
World Class Software Development Tools

Assembler/Linker/Librarian

The MPLAB ASM30 is a full-featured macro assembler. User defined macros, conditional assembly and a variety of assembler directives make the MPLAB ASM30 a powerful code generation tool.

The MPLAB LINK30 and MPLAB LIB30 are Linker and Librarian modules that allow efficient linking, library creation and maintenance.

MPLAB C30 C Compiler

The MPLAB C30 C Compiler is a full-featured, ANSI compliant optimizing compiler. The MPLAB C30 C Compiler includes a complete ANSI C standard library, including string manipulation, dynamic memory allocation, data conversion, timekeeping and math libraries.

The MPLAB C30 C Compiler has a powerful code optimizer; other 16-bit MCUs generate as much as 165 percent larger code for the same application.

Relative Code Size (in Bytes)

Industry Leading C Code Efficiency

The dsPIC30F was designed with a robust, full-featured instruction set optimized for C compiler efficiency from the start. Coupled with Microchip’s highly optimized MPLAB C30 C Compiler, this combination produces results that fit into a smaller sized on-chip Flash memory.

MPLAB SIM Software Simulator

The MPLAB SIM Software Simulator is a full-featured, cycle accurate software simulator. In addition to simulating the CPU and the instruction set, it also supports key peripherals, such as timers, I/O, interrupts, UART and A/D modules. MPLAB SIM has powerful stimulus capabilities and file I/O. It is ideal for the algorithm development.

MPLAB VDI Visual Device Initializer

Configuring a powerful 16-bit MCU or DSP can be a complex and challenging task, but not with the dsPIC30F devices. Our MPLAB VDI Visual Device Initializer allows you to configure the entire processor graphically and when complete, a mouse click generates initialization code usable in Assembly or C programs.

The MPLAB VDI Visual Device Initializer does extensive error checking on assignments and conflicts on pins, memories and interrupts, as well as a selection of operating conditions. The generated code files are effortlessly integrated with the rest of your application code through MPLAB project manager.

The detailed reports on resource assignment and configuration simplify project documentation. Key features of the MPLAB VDI Visual Device Initializer:

- Drag-and-drop feature selection
- One click configuration
- Extensive error checking
- Generates initialization code
- Integrates effortlessly in MPLAB project manager
- Printed reports ease project documentation requirements

Download a full-featured, time-restricted demonstration version of the MPLAB C30 C Compiler from the Microchip web site for your evaluation.
Plug and Play with Our Connectivity Libraries

TCP/IP Protocol Stack

**MicroNet™ TCP/IP Stack by CMX**
Connect to the Internet using proven, professional quality TCP/IP software libraries. CMX-MicroNet™ is an embedded TCP/IP stack that is specifically designed for optimized use of flash and RAM resources on Microchip’s dsPIC30F. The software runs directly on the processor with no gateways or PCs required. The stack can be run in stand alone mode or work in conjunction with an RTOS. Using only industry standard protocols, CMX-MicroNet offers true TCP/IP networking via direct, dial-up or Ethernet connectivity and wireless Ethernet (802.11b) as well.

Up to 127 sockets can be open at a time. They can be Ethernet sockets and/or PPP or SLIP sockets. PPP and SLIP cannot be used at the same time. An HTTP web server, FTP server, SMTP client and DHCP client are also available. The RS-232 link, if used, can either be a direct cable link or through a modem. This library can be readily implemented on the dsPICDEM.net Connectivity Board.

**Microchip Free TCP/IP Stack**
The Microchip TCP/IP Stack is now supported on the dsPIC30F product family. This stack is a suite of programs that provide services for standard TCP/IP-based applications (HTTP Server, Mail Client, etc.) or it can be used in a custom TCP/IP-based application. Potential users do not need to know all of the intricacies of the TCP/IP specifications to use it, and those interested only in the accompanying HTTP Server application need not have specific knowledge of TCP/IP. This stack is implemented in a modular fashion, with all of its services creating highly abstracted layers, each layer accessing services from all of its services creating highly abstracted layers, each layer accessing services from any or more layers directly below it. The stack is optimized for size and is designed to run on the dsPIC DSC. While this particular implementation is specifically targeted to run on the dsPICDEM.net Connectivity Board, it can be easily retargeted to any hardware equipped with a dsPIC30F device. HTML web pages generated by the dsPIC DSC can be viewed with a standard web browser such as Microsoft® Internet Explorer.

**Soft Modem Libraries**

**V.22bis/V.22 Soft Modem Library**
This library is available free of charge from the Microchip web site. The V.22bis Soft Modem Library is a collection of algorithms for ITU-T compliant V.21/Bell 103, V.22 and V.22bis modems and V.42 recommendations. The V.22bis library comes with full source code and archives that contain object code modules required for linking with your application. The transmit and receive data pump code modules are coded in Assembly language for optimal speed and smallest code size, while the AT, V.42 and Data Pump APIs are coded in C. Hardware component drivers, such as UART and Data Converter Interface (DCI) for Analog Front End (AFE) I/O are provided. This library can be readily implemented on the dsPICDEM.net Connectivity Board.

**V.32bis Soft Modem Library**
The V.32bis Soft Modem Library is a collection of algorithms for ITU-T compliant V.21/Bell 103, V.22, V.22bis and V.32bis modems and V.42 recommendations. The V.32bis library is provided with archives that contain object code modules required for linking with your application. The transmit and receive data pump code modules are coded in Assembly language for optimal speed and smallest code size, while the AT, V.42 and Data Pump APIs are coded in C. Hardware component drivers, such as UART and DCI for AFE I/O are provided. This library can be readily implemented on the dsPICDEM.net Connectivity Board.

**V.32/V.22/V.22bis by VOCAL Technologies, LTD**
The Soft Modem Library is a collection of data modulations and protocols (V.32, V.22, V.22bis, V.23, V.21, Bell 103, Bell 212A and Bell 202). This library is provided with archives that contain object code modules, which link to your application. The data modulation is coded in C with inline Assembly language optimization for speed and code size. Hardware component drivers, such as UART and DCI for AFE I/O are provided. This library can be readily implemented on the dsPICDEM.net Connectivity Board.
**Libraries for Speech Applications**

**Noise Suppression Library**

This application library suppresses the noise interference in a speech signal, such as ambient noise picked up by a microphone while capturing speech. This algorithm is particularly useful for systems where isolated noise reference is not available—such as hands-free phones, speakerphones, intercoms and headsets.

The library is written in Assembly language for maximum optimization of code size and execution speed. It can be easily integrated in C or Assembly code. The algorithm handles 0-4 kHz audio bandwidth (8 kHz sampling of 16-bit speech data) and provides 10-20 dB noise reduction. The library also includes some sample rate conversion functions to support input/output sampling rates of 9.6 kHz, 11.025 kHz and 12 kHz.

**Acoustic Echo Cancellation Library**

This library provides a function to eliminate the echo generated in the acoustic path between a speaker and a microphone, such as in a speakerphone or an intercom system.

This library is fully compliant with the G.167 standard, supports cancellation and provides 16, 32 or 64 ms echo delays. It handles 0-4 kHz audio bandwidth (8 kHz sampling of 16-bit speech data) and provides echo cancellation of 40-50 dB. Written in Assembly language for optimal code size and execution speed, this library can be easily integrated in C or Assembly code. The library also includes some sample rate conversion functions to support input/output sampling rates of 9.6 kHz, 11.025 kHz and 12 kHz.

**Speech Encoding/Decoding Library**

This application library performs speech compression and decompression and is based on a modified open-source Speex technology. The library features a 16:1 compression ratio and an 8 kbps data rate. This makes the library a good choice for digital voice communication, store-and-playback and playback-only applications. For playback-only applications, a PC software utility is included which allows the designer to create encoded speech files for playback. The input source may be either a microphone of WAV file.

**Speech Recognition**

Automatic Speech Recognition (ASR) for the dsPIC30F family can support a wide range of voice-activated applications such as handset and home appliance control. A Speech Word Library Builder and a Speech Recognition Software Library make up the ASR software suite. Key features of the ASR application software:
More Application Libraries Ready to Use

Encryption Libraries

Implement reliable secure applications using the Symmetric and Asymmetric Key Embedded Encryption Libraries. Developed for Microchip by NTRU Cryptosystems Inc., a leader in encryption solutions, these libraries are both proven and optimized. These library functions can be easily called by your C or Assembly code.

The algorithms included in these libraries have emerged as de facto standards for many large scale secure applications such as web access (SSL/TLS), E-mail (S-MIME), secure XML transactions and virtual private networks (IPsec). These algorithms are also recommended by Federal Information Processing Standards (FIPS) and the Internet Engineering Task Force (IETF).

Encryption Libraries features:
- **Symmetric Key Embedded Encryption Library features:**
  - 128-bit AES in ECB, CTR, CBC, CBC-MAC and CCM modes
  - Triple DES in ECB, CTR, CBC and CBC-MAC modes
  - SHA-1
  - MD5
  - Random number generator (DRBG X9.82)

- **Asymmetric Key Embedded Encryption Library features:**
  - RSA (1024-bit and 2048-bit modulus)
    - Encryption/decryption
    - Signing/verification
  - DSA (1024-bit modulus)
    - Private/public key generation
    - Signing/verification
  - Diffie-Hellman Key Agreement (1024-bit and 2048-bit modulus)
    - Private/public key generation
    - Shared key generation
  - SHA-1
  - MD5
  - Random number generator (DRBG X9.82)

Motor Control Application Software

The dsPIC30F motor control family of devices is suited for advanced AC Induction Motor (ACIM), Brushless DC (BLDC) and Switched Reluctance (SR) motor applications. Two advanced applications are currently available that run on the dsPIC30F Motor Control Development System.

- **Sensorless BLDC Control**
  - This application note describes a fully-tested sensorless control algorithm for a 3-phase BLDC motor. Motor current, motor velocity and bus voltage are regulated in control loops. A LCD menu interface provides adjustment of all sensorless motor control parameters. Full documentation and source code are available for free on the Microchip web site (Application Note: AN957).

- **Introduction of ACIM Control**
  - This application note is an introductory approach to the methods described in Application Note: AN908. Code is provided in an example that provides basic variable speed control of a single or three-phase ACIM. Full documentation and source code are available for free on the Microchip web site (Application Note: AN984).

$5 Evaluation License for Evaluation and Development

A common issue with software libraries is that in order to evaluate the complete library, you must enter into a complex and expensive license arrangement. Any Microchip dsPIC DSC library can be licensed for $5.00 for evaluation and development purposes. These libraries are complete and unchanged from the production libraries, not reduced function evaluation versions. Evaluation licenses are available from the Microchip web site (http://buy.microchip.com). Licenses for production are based on a simple low cost one-time license fee. Production licenses are available from Microchip or from our authorized distributors.

Vector Control of an ACIM

This application note describes a fully-tested vector, or field oriented, control algorithm for a 3-phase ACIM. The motor currents, torque and velocity are regulated in control loops. Full documentation and source code are available for free on the Microchip web site (Application Note: AN908).

Sensorless BLDC Control

This application note describes a fully-tested sensorless control algorithm for a 3-phase BLDC motor. Motor current, motor velocity and bus voltage are regulated in control loops. A LCD menu interface provides adjustment of all sensorless motor control parameters. Full documentation and source code are available for free on the Microchip web site (Application Note: AN901).
Operating Systems and Communication Drivers

RTOS

If you need a Real-Time Operating System (RTOS) to handle multitasking, we have a three-tier solution for you.

- CMX-RTX™: full-featured fully preemptive multi-tasking OS
- CMX-Tiny+™: fully preemptive scaled-down version of the RTX OS
- CMX-Scheduler™: fully preemptive multi-tasking mini OS (FREE)

All three operating systems are fully preemptive and written in Assembly language optimized for maximum performance. These RTOS products are developed by CMX and available from Microchip and CMX.

OSEK and CAN Drivers

Vector Informatik GmbH provides automotive operating systems, sometimes labeled as an OSEK operating system. The Vector Informatik osCAN operating system, which is based on the OSEK/VDX® standard, provides a multitasking operating system with optimal features for use on MCUs. This product represents a small, sturdy operating system kernel.

The companion support for managing the CAN interface drivers on the dsPIC30F family of products is the CANbedded CAN driver suite from Vector Informatik. This product consists of a number of adaptive source code modules that cover the basic communication requirements in automotive applications.

Online Resources for Self-paced Learning

Microchip offers extensive online resources for designers ranging from downloadable documentation to web seminars (webinars) to online discussion groups. All of these helpful resources are accessible on www.microchip.com/webseminars and are updated frequently with the most current information on our products and services.

To watch an archived Webinar, you need:
- Windows Media Player v6 or higher
- sound card

Notes:
- Unzipped media files are large approximately 20 to 50 MB each
- Performance of media files may be affected by type of video card, amount of system RAM and CPU speed
Hardware Development Tools

MPLAB ICD 2
In-Circuit Debugger

The MPLAB ICD 2 In-Circuit Debugger is a powerful, low-cost development tool. Running under MPLAB IDE, MPLAB ICD 2 can debug ASM or C source code, watch and modify variables, single step and set breakpoints. Key features of the MPLAB ICD 2:

- Full speed operation
- USB or serial port connection to PC
- Supports full dsPIC DSC supply voltage range
- Can be used as an inexpensive programmer
- Smart watch variable windows
- Advanced breakpoint features

MPLAB PM3
Device Programmer

MPLAB PM3 Device Programmer is a full-featured, production quality universal device programmer. Using interchangeable socket modules, the MPLAB PM3 supports virtually all programmable devices from Microchip. MPLAB PM3 has improved programming time for many devices and offers built-in interface for robust In-Circuit Serial Programming™ (ICSP™).

If you already own a PRO MATE® II Device Programmer, the dsPIC30F family is supported on the PRO MATE II Device Programmer through a new set of socket modules.

MPLAB ICE 4000
In-Circuit Emulator

The powerful, full-featured real-time MPLAB ICE 4000 In-Circuit Emulator is capable of debugging the most demanding real-time systems. Key features of the MPLAB ICE 4000 In-Circuit Emulator:

- Full speed, real-time emulation
- Supports full dsPIC DSC supply voltage range
- 64K deep by 216-bit wide trace memory
- Unlimited breakpoints
- Complex break, trace and trigger logic
- Multi-level trigger up to four levels
- 48-bit time stamp
- USB connection to PC
- Stopwatch
Hardware Development Boards: Jump-start Your Design

A variety of hardware development boards are available for the dsPIC30F, enabling you to shorten your design cycle. These boards are designed to allow easy plug-in of an MPLAB ICD 2 or an MPLAB ICE 4000 emulator.

**dsPICDEM™ Starter Development Board**

This Development Board offers a very economical way to evaluate the dsPIC30F General Purpose Family devices. Key features of the dsPICDEM Starter Development Board:

- Includes a 64-pin dsPIC30F6012 plug-in module (MA300012)
- Power input from 9V supply
- LEDs, switches, potentiometer, UART interface
- A/D input filter circuit for speech-band signal input
- On-board DAC and filter for speech-band signal output
- Circuit prototyping area
- Assembly language demonstration program and tutorial

**dsPICDEM 28-Pin Starter Development Board**

This Development Board provides an economical solution to get started with 28-pin dsPIC30F devices, including Motor Control, Sensor and Power Conversion Families. Key features of the dsPICDEM 28-Pin Starter Development Board:

- Includes a 28-pin dsPIC30F2010 device
- Power input from 9V power supply
- UART interface
- Header for access to all device I/O pins
- Circuit prototyping area
- Assembly language demonstration program and tutorial
- Accommodates all dsPIC30F 28-pin devices
**Advanced Development Boards: Complex Designs Made Simple**

**dsPICDEM 1.1 General Purpose Development Board**

Key features of the dsPICDEM General Purpose Development Board are:

- Includes a dsPIC30F6014 plug-in module (MA300011)
- Serial communication channels (two UART, SPI, CAN)
- Si3000 codec with MIC IN/speaker OUT
- General purpose prototyping area and expansion header
- 122 x 32 dot addressable LCD
- Digital potentiometer for DAC capability
- LEDs, switches, potentiometers and temperature sensor
- MPLAB ICD 2 and MPLAB ICE 4000 emulator support

**dsPICDEM.net™ Connectivity Development Boards**

Key features of the dsPICDEM.net Connectivity Development Boards are:

- Includes a dsPIC30F6014 plug-in module (MA300011)
- 10-Base T Ethernet MAC and PHY interface
- PSTN interface with DAA/AFE chipset
- Serial communication channels (UART and CAN)
- External EEPROM memory for storing constants
- External 64K x 16 SRAM memory
- General purpose prototyping area and expansion header
- LEDs, switches, potentiometers and temperature sensor
- 2 x 16 LCD display
- MPLAB ICD 2 and MPLAB ICE 4000 emulator support
- dsPICDEM.net 1 (DM300004-1)
  - Support for FCC/JATE PSTN countries
- dsPICDEM.net 2 (DM300004-2)
  - Support for CTR-21 PSTN countries

**Motor Control Development System**

The Motor Control Development System provides you with a method for quick prototyping and validation of BLDC, SR, PMAC, ACIM and UPS applications. The system consists of the dsPICDEM MC1 Motor Control Development Board and one of two optional power modules. The dsPICDEM MC1H 3-Phase High-Voltage Power Module (DM300021) supports AC line-powered applications, while the dsPICDEM MC1L 3-Phase Low-Voltage Power Module (DM300022) supports DC-powered applications up to 48V. Some key features of the Motor Control Development System:

- Heat sink for ambient cooling of power sections
- Full automatic protection of power circuits
- Electrical isolation from power circuits
- Many options for motor feedback signals
- MPLAB ICD 2 and MPLAB ICE 4000 emulator support

Note: Power module shown with dsPICDEM MC1 Development Board DM300020

Includes a dsPIC30F6010 plug-in module (MA300013)

Plug-in Modules for Development Boards

A Plug-in Module (PIM) is a daughter board with a dsPIC30F device soldered on top and header socket strips on the bottom. The PIMs use the device header pins, on the dsPIC DSC development boards, which also support the MPLAB ICE 4000 emulator device adapters. This method allows for easy swapping of devices onto the various development boards, without having to unsolder and resolder parts.
