MCP1826/MCP1826S

1000 mA, Low Voltage, Low Quiescent Current LDO Regulator

Features

- 1000 mA Output Current Capability
- Input Operating Voltage Range: 2.3V to 6.0V
- Adjustable Output Voltage Range: 0.8V to 5.0V (MCP1826 only)
- Standard Fixed Output Voltages:
  - 0.8V, 1.2V, 1.8V, 2.5V, 3.0V, 3.3V, 5.0V
- Other Fixed Output Voltage Options Available Upon Request
- Low Dropout Voltage: 250 mV Typical at 1000 mA
- Typical Output Voltage Tolerance: 0.5%
- Stable with 1.0 µF Ceramic Output Capacitor
- Fast response to Load Transients
- Low Supply Current: 120 µA (typ)
- Low Shutdown Supply Current: 0.1 µA (typ) (MCP1826 only)
- Fixed Delay on Power Good Output (MCP1826 only)
- Short Circuit Current Limiting and Overtemperature Protection
- TO-263-5 (DDPAK-5), TO-220-5, SOT-223-5 Package Options (MCP1826).
- TO-263-3 (DDPAK-3), TO-220-3, SOT-223-3 Package Options (MCP1826S).

Applications

- High-Speed Driver Chipset Power
- Networking Backplane Cards
- Notebook Computers
- Network Interface Cards
- Palmtop Computers
- 2.5V to 1.XV Regulators

Description

The MCP1826/MCP1826S is a 1000 mA Low Dropout (LDO) linear regulator that provides high current and low output voltages. The MCP1826 comes in a fixed or adjustable output voltage version, with an output voltage range of 0.8V to 5.0V. The 1000 mA output current capability, combined with the low output voltage capability, make the MCP1826 a good choice for new sub-1.8V output voltage LDO applications that have high current demands. The MCP1826S is a 3-pin fixed voltage version.

The MCP1826/MCP1826S is stable using ceramic output capacitors that inherently provide lower output noise and reduce the size and cost of the entire regulator solution. Only 1 µF of output capacitance is needed to stabilize the LDO.

Using CMOS construction, the quiescent current consumed by the MCP1826/MCP1826S is typically less than 120 µA over the entire input voltage range, making it attractive for portable computing applications that demand high output current. The MCP1826 versions have a Shutdown (SHDN) pin. When shut down, the quiescent current is reduced to less than 0.1 µA.

On the MCP1826 fixed output versions the scaled-down output voltage is internally monitored and a power good (PWRGD) output is provided when the output is within 92% of regulation (typical). The PWRGD delay is internally fixed at 200 µs (typical).

The overtemperature and short circuit current-limiting provide additional protection for the LDO during system fault conditions.
## Package Types

### MCP1826

**DDPAK-5**
- Fixed/Adjustable

**TO-220-5**

### MCP1826S

Typical Application

**MCP1826 Fixed Output Voltage**

- **VOUT = 1.8V @ 1000 mA**
- **VIN = 2.3V to 2.8V**
- **C1**: 4.7 µF
- **C2**: 1 µF
- **R1**: 100 kΩ

**MCP1826 Adjustable Output Voltage**

- **VOUT = 1.2V @ 1000 mA**
- **VIN = 2.3V to 2.8V**
- **C1**: 4.7 µF
- **C2**: 1 µF
- **R1**: 40 kΩ
- **R2**: 20 kΩ

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

VIN.................................................................6.5V
Maximum Voltage on Any Pin .. (GND – 0.3V) to (VDD + 0.3)V
Maximum Power Dissipation........ Internally-Limited (Note 6)
Output Short Circuit Duration................................Continuous
Storage temperature .....................................-65°C to +150°C
Maximum Junction Temperature, TJ ........................... +150°C
ESD protection on all pins (HBM/MM) ........... ≥ 4 kV; ≥ 300V

† Notice: Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

AC/DC CHARACTERISTICS

Electrical Specifications: Unless otherwise noted, VIN = VOUT(MAX) + VDROPOUT(MAX), Note 1, VR=1.8V for Adjustable Output, IOUT = 1 mA, CIN = COUT = 4.7 µF (X7R Ceramic), TA = +25°C.

Boldface type applies for junction temperatures, TJ (Note 7) of -40°C to +125°C

<th>V</th>
<th>Note 2</th>
</tr>
</thead>
</table>

Note 1: The minimum VIN must meet two conditions: VIN ≥ 2.3V and VIN ≥ VOUT(MAX) + VDROPOUT(MAX).
2: VR is the nominal regulator output voltage for the fixed cases. VR = 1.2V, 1.8V, etc. VRQ is the desired set point output voltage for the adjustable cases. VR = VADJ - ((R1/R2)+1), Figure 4-1.
3: TCVOUT = (VOUT-HIGH – VOUT-LOW) *10^6 / (VR * ΔTemperature), VOUT-HIGH is the highest voltage measured over the temperature range, VOUT-LOW is the lowest voltage measured over the temperature range.
4: Load regulation is measured at a constant junction temperature using low duty-cycle pulse testing. Load regulation is tested over a load range from 1 mA to the maximum specified output current.
5: Dropout voltage is defined as the input-to-output voltage differential at which the output voltage drops 2% below its nominal value that was measured with an input voltage of VIN = VOUT(MAX) + VDROPOUT(MAX).
6: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air. (i.e., TA, TJ, θJA). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +150°C rating. Sustained junction temperatures above 150°C can impact device reliability.
7: The junction temperature is approximated by soaking the device under test at an ambient temperature equal to the desired junction temperature. The test time is small enough such that the rise in the junction temperature over the ambient temperature is not significant.

3.1 Shutdown Control Input (SHDN)

The SHDN input is used to turn the LDO output voltage on and off. When the SHDN input is at a logic-high level, the LDO output voltage is enabled. When the SHDN input is pulled to a logic-low level, the LDO output voltage is disabled. When the SHDN input is pulled low, the PWRGD output also goes low and the LDO enters a low quiescent current shutdown state where the typical quiescent current is 0.1 µA.

3.2 Input Voltage Supply (VIN)

Connect the unregulated or regulated input voltage source to VIN. If the input voltage source is located several inches away from the LDO, or the input source is a battery, it is recommended that an input capacitor be used. A typical input capacitance value of 1 µF to 10 µF should be sufficient for most applications.

3.3 Ground (GND)

Connect the GND pin of the LDO to a quiet circuit ground. This will help the LDO power supply rejection ratio and noise performance. The ground pin of the LDO only conducts the quiescent current of the LDO (typically 120 µA), so a heavy trace is not required. For applications have switching or noisy inputs tie the GND pin to the return of the output capacitor. Ground planes help lower inductance and voltage spikes caused by fast transient load currents and are recommended for applications that are subjected to fast load transients.

3.4 Regulated Output Voltage (VOUT)

The VOUT pin is the regulated output voltage of the LDO. A minimum output capacitance of 1.0 µF is required for LDO stability. The MCP1826/MCP1826S is stable with ceramic, tantalum and aluminum-electrolytic capacitors. See Section 4.3 “Output Capacitor” for output capacitor selection guidance.

3.5 Power Good Output (PWRGD)

The PWRGD output is an open-drain output used to indicate when the LDO output voltage is within 92% (typically) of its nominal regulation value. The PWRGD threshold has a typical hysteresis value of 2%. The PWRGD output is delayed by 200 µs (typical) from the time the LDO output is within 92% + 3% (max hysteresis) of the regulated output value on power-up. This delay time is internally fixed.

3.6 Output Voltage Adjust Input (ADJ)

For adjustable applications, the output voltage is connected to the ADJ input through a resistor divider that sets the output voltage regulation value. This provides the user the capability to set the output voltage to any value they desire within the 0.8V to 5.0V range of the device.

3.7 Exposed Pad (EP)

The DDPAK and TO-220 package have an exposed tab on the package. A heat sink may be mount to the tab to aid in the removal of heat from the package during operation. The exposed tab is at the ground potential of the LDO.
4.0 DEVICE OVERVIEW

The MCP1826/MCP1826S is a high output current, Low Dropout (LDO) voltage regulator. The low dropout voltage of 300 mV typical at 1000 mA of current makes it ideal for battery-powered applications. Unlike other high output current LDOs, the MCP1826/MCP1826S only draws a maximum of 220 µA of quiescent current. The MCP1826 has a shutdown control input and a power good output.

4.1 LDO Output Voltage

The 5-pin MCP1826 LDO is available with either a fixed output voltage or an adjustable output voltage. The output voltage range is 0.8V to 5.0V for both versions. The 3-pin MCP1826S LDO is available as a fixed voltage device.

4.1.1 ADJUST INPUT

The adjustable version of the MCP1826 uses the ADJ pin (pin 5) to get the output voltage feedback for output voltage regulation. This allows the user to set the output voltage of the device with two external resistors. The nominal voltage for ADJ is 0.41V.

Figure 4-1 shows the adjustable version of the MCP1826. Resistors R1 and R2 form the resistor divider network necessary to set the output voltage. With this configuration, the equation for setting $V_{OUT}$ is:

\[ V_{OUT} = V_{ADJ} \left( \frac{R_1 + R_2}{R_2} \right) \]

Where:
- $V_{OUT}$ = LDO Output Voltage
- $V_{ADJ}$ = ADJ Pin Voltage (typically 0.41V)

4.2 Output Current and Current Limiting

The MCP1826/MCP1826S LDO is tested and ensured to supply a minimum of 1000 mA of output current. The MCP1826/MCP1826S has no minimum output load, so the output load current can go to 0 mA and the LDO will continue to regulate the output voltage to within tolerance.

The MCP1826/MCP1826S also incorporates an output current limit. If the output voltage falls below 0.7V due to an overload condition (usually represents a shorted load condition), the output current is limited to 2.2A (typical). If the overload condition is a soft overload, the MCP1826/MCP1826S will supply higher load currents of up to 2.5A. The MCP1826/MCP1826S should not be operated in this condition continuously as it may result in failure of the device. However, this does allow for device usage in applications that have higher pulsed load currents having an average output current value of 1000 mA or less.

Output overload conditions may also result in an over-temperature shutdown of the device. If the junction temperature rises above 150°C, the LDO will shut down the output voltage. See Section 4.8 “Overtemperature Protection” for more information on overtemperature shutdown.

4.3 Output Capacitor

The MCP1826/MCP1826S requires a minimum output capacitance of 1 µF for output voltage stability. Ceramic capacitors are recommended because of their size, cost and environmental robustness qualities.

Aluminum-electrolytic and tantalum capacitors can be used on the LDO output as well. The Equivalent Series Resistance (ESR) of the electrolytic output capacitor must be no greater than 1 ohm. The output capacitor should be located as close to the LDO output as is practical. Ceramic materials X7R and X5R have low temperature coefficients and are well within the acceptable ESR range required. A typical 1 µF X7R 0805 capacitor has an ESR of 50 milli-ohms.

Larger LDO output capacitors can be used with the MCP1826/MCP1826S to improve dynamic performance and power supply ripple rejection performance. A maximum of 22 µF is recommended. Aluminum-electrolytic capacitors are not recommended for low-temperature applications of ≤ 25°C.
4.4 Input Capacitor

Low input source impedance is necessary for the LDO output to operate properly. When operating from batteries, or in applications with long lead length (> 10 inches) between the input source and the LDO, some input capacitance is recommended. A minimum of 1.0 μF to 4.7 μF is recommended for most applications.

For applications that have output step load requirements, the input capacitance of the LDO is very important. The input capacitance provides the LDO with a good local low-impedance source to pull the transient currents from in order to respond quickly to the output load step. For good step response performance, the input capacitor should be of equivalent (or higher) value than the output capacitor. The capacitor should be placed as close to the input of the LDO, as is practical. Larger input capacitors will also help reduce any high-frequency noise on the input and output of the LDO and reduce the effects of any inductance that exists between the input source voltage and the input capacitance of the LDO.

4.5 Power Good Output (PWRGD)

The PWRGD output is used to indicate when the output voltage of the LDO is within 92% (typical value, see Section 1.0 "Electrical Characteristics" for Minimum and Maximum specifications) of its nominal regulation value.

As the output voltage of the LDO rises, the PWRGD output will be held low until the output voltage has exceeded the power good threshold plus the hysteresis value. Once this threshold has been exceeded, the power good time delay is started (shown as T_PG in the Electrical Characteristics table). The power good time delay is fixed at 200 μs (typical). After the time delay period, the PWRGD output will go high, indicating that the output voltage is stable and within regulation limits.

If the output voltage of the LDO falls below the power good threshold, the power good output will transition low. The power good circuitry has a 170 μs delay when detecting a falling output voltage, which helps to increase noise immunity of the power good output and avoid false triggering of the power good output during fast output transients. See Figure 4-2 for power good timing characteristics.

When the LDO is put into Shutdown mode using the SHDN input, the power good output is pulled low immediately, indicating that the output voltage will be out of regulation. The timing diagram for the power good output when using the shutdown input is shown in Figure 4-3.

The power good output is an open-drain output that can be pulled up to any voltage that is equal to or less than the LDO input voltage. This output is capable of sinking 1.2 mA (VPWRGD < 0.4V maximum).

4.6 Shutdown Input (SHDN)

The SHDN input is an active-low input signal that turns the LDO on and off. The SHDN threshold is a percentage of the input voltage. The typical value of this shutdown threshold is 30% of VIN, with minimum and maximum limits over the entire operating temperature range of 45% and 15%, respectively.

The SHDN input will ignore low-going pulses (pulses meant to shut down the LDO) that are up to 400 ns in pulse width. If the shutdown input is pulled low for more than 400 ns, the LDO will enter Shutdown mode. This small bit of filtering helps to reject any system noise spikes on the shutdown input signal.

On the rising edge of the SHDN input, the shutdown circuitry has a 30 μs delay before allowing the LDO output to turn on. This delay helps to reject any false turn-on signals or noise on the SHDN input signal. After
the 30 µs delay, the LDO output enters its soft-start period as it rises from 0V to its final regulation value. If the SHDN input signal is pulled low during the 30 µs delay period, the timer will be reset and the delay time will start over again on the next rising edge of the SHDN input. The total time from the SHDN input going high (turn-on) to the LDO output being in regulation is typically 100 µs. See Figure 4-4 for a timing diagram of the SHDN input.

4.7 Dropout Voltage and Undervoltage Lockout

Dropout voltage is defined as the input-to-output voltage differential at which the output voltage drops 2% below the nominal value that was measured with a VR + 0.5V differential applied. The MCP1826/MCP1826S LDO has a very low dropout voltage specification of 300 mV (typical) at 1000 mA of output current. See Section 1.0 “Electrical Characteristics” for maximum dropout voltage specifications.

The MCP1826/MCP1826S LDO operates across an input voltage range of 2.3V to 6.0V and incorporates input Undervoltage Lockout (UVLO) circuitry that keeps the LDO output voltage off until the input voltage reaches a minimum of 2.00V (typical) on the rising edge of the input voltage. As the input voltage falls, the LDO output will remain on until the input voltage level reaches 1.82V (typical).

Since the MCP1826/MCP1826S LDO undervoltage lockout activates at 1.82V as the input voltage is falling, the dropout voltage specification does not apply for output voltages that are less than 1.8V.

For high-current applications, voltage drops across the PCB traces must be taken into account. The trace resistances can cause significant voltage drops between the input voltage source and the LDO. For applications with input voltages near 2.3V, these PCB trace voltage drops can sometimes lower the input voltage enough to trigger a shutdown due to undervoltage lockout.

4.8 Overtemperature Protection

The MCP1826/MCP1826S LDO has temperature-sensing circuitry to prevent the junction temperature from exceeding approximately 150°C. If the LDO junction temperature does reach 150°C, the LDO output will be turned off until the junction temperature cools to approximately 140°C, at which point the LDO output will automatically resume normal operation. If the internal power dissipation continues to be excessive, the device will again shut off. The junction temperature of the die is a function of power dissipation, ambient temperature and package thermal resistance. See Section 5.0 “Application Circuits/Issues” for more information on LDO power dissipation and junction temperature.
5.0 APPLICATION CIRCUITS/ISSUES

5.1 Typical Application

The MCP1826/MCP1826S is used for applications that require high LDO output current and a power good output.

**FIGURE 5-1:** Typical Application Circuit.

5.1.1 APPLICATION CONDITIONS

- Package Type = TO-220-5
- Input Voltage Range = 3.3V ± 5%
- $V_{IN}$ maximum = 3.465V
- $V_{IN}$ minimum = 3.135V
- $V_{DROPOUT(max)}$ = 0.350V
- $V_{OUT}(typical)$ = 2.5V
- $I_{OUT}$ = 1000 mA maximum
- $P_{DISS}(typical)$ = 0.965W
- Temperature Rise = 28.27 °C

5.2 Power Calculations

5.2.1 POWER DISSIPATION

The internal power dissipation within the MCP1826/MCP1826S is a function of input voltage, output voltage, output current and quiescent current. Equation 5-1 can be used to calculate the internal power dissipation for the LDO.

**EQUATION 5-1:**

$$P_{LDO} = (V_{IN(MAX)} - V_{OUT(MIN)}) \times I_{OUT(MAX)}$$

Where:

- $P_{LDO}$ = LDO Pass device internal power dissipation
- $V_{IN(MAX)}$ = Maximum input voltage
- $V_{OUT(MIN)}$ = LDO minimum output voltage

In addition to the LDO pass element power dissipation, there is power dissipation within the MCP1826/MCP1826S as a result of quiescent or ground current. The power dissipation as a result of the ground current can be calculated using the following equation:

**EQUATION 5-2:**

$$P_{I(GND)} = V_{IN(MAX)} \times I_{VIN}$$

Where:

- $P_{I(GND)}$ = Power dissipation due to the quiescent current of the LDO
- $V_{IN(MAX)}$ = Maximum input voltage
- $I_{VIN}$ = Current flowing in the $V_{IN}$ pin with no LDO output current (LDO quiescent current)

The total power dissipated within the MCP1826/MCP1826S is the sum of the power dissipated in the LDO pass device and the $P_{I(GND)}$ term. Because of the CMOS construction, the typical $I_{GND}$ for the MCP1826/MCP1826S is 120 µA. Operating at a maximum $V_{IN}$ of 3.465V results in a power dissipation of 0.12 milli-Watts for a 2.5V output. For most applications, this is small compared to the LDO pass device power dissipation and can be neglected.

The maximum continuous operating junction temperature specified for the MCP1826/MCP1826S is +125°C. To estimate the internal junction temperature of the MCP1826/MCP1826S, the total internal power dissipation is multiplied by the thermal resistance from junction to ambient ($R_{\theta JA}$) of the device. The thermal resistance from junction to ambient for the TO-220-5 package is estimated at 29.3°C/W.

**EQUATION 5-3:**

$$T_{J(MAX)} = P_{TOTAL} \times R_{\theta JA} + T_{AMAX}$$

Where:

- $T_{J(MAX)}$ = Maximum continuous junction temperature
- $P_{TOTAL}$ = Total device power dissipation
- $R_{\theta JA}$ = Thermal resistance from junction to ambient
- $T_{AMAX}$ = Maximum ambient temperature
The maximum power dissipation capability for a package can be calculated given the junction-to-ambient thermal resistance and the maximum ambient temperature for the application. Equation 5-4 can be used to determine the package maximum internal power dissipation.

**EQUATION 5-4:**

\[
P_{D\text{(MAX)}} = \frac{(T_{J\text{(MAX)}} - T_{A\text{(MAX)}})}{R_{\theta JA}}
\]

- \(P_{D\text{(MAX)}}\) = Maximum device power dissipation
- \(T_{J\text{(MAX)}}\) = maximum continuous junction temperature
- \(T_{A\text{(MAX)}}\) = maximum ambient temperature
- \(R_{\theta JA}\) = Thermal resistance from junction-to-ambient

**5.3 Typical Application**

Internal power dissipation, junction temperature rise, junction temperature and maximum power dissipation is calculated in the following example. The power dissipation as a result of ground current is small enough to be neglected.

**5.3.1 POWER DISSIPATION EXAMPLE**

**Package**

- Package Type = TO-220-5

**Input Voltage**

- \(V_{IN}\) = 3.3V ± 5%

**LDO Output Voltage and Current**

- \(V_{OUT}\) = 2.5V
- \(I_{OUT}\) = 1000 mA

**Maximum Ambient Temperature**

- \(T_{A\text{(MAX)}}\) = 60°C

**Internal Power Dissipation**

\[
\begin{align*}
P_{\text{LDO\text{(MAX)}}} &= (V_{\text{IN\text{(MAX)}}} - V_{\text{OUT\text{(MIN)}}}) \times I_{\text{OUT\text{(MAX)}}} \\
P_{\text{LDO}} &= ((3.3V \times 1.05) - (2.5V \times 0.975)) \times 1000 \text{ mA} \\
P_{\text{LDO}} &= 1.028 \text{ Watts}
\end{align*}
\]

**5.3.1.1 Device Junction Temperature Rise**

The internal junction temperature rise is a function of internal power dissipation and the thermal resistance from junction-to-ambient for the application. The thermal resistance from junction-to-ambient (\(R_{\theta JA}\)) is derived from EIA/JEDEC standards for measuring thermal resistance. The EIA/JEDEC specification is JESD51. The standard describes the test method and board specifications for measuring the thermal resistance from junction to ambient. The actual thermal resistance for a particular application can vary depending on many factors such as copper area and thickness. Refer to AN792, “A Method to Determine How Much Power a SOT23 Can Dissipate in an Application” (DS00792), for more information regarding this subject.

\[
\begin{align*}
T_{J\text{(RISE)}} &= P_{\text{TOTAL}} \times R_{\theta JA} \\
T_{J\text{RISE}} &= 1.028 \text{ W} \times 29.3^\circ C/W \\
T_{J\text{RISE}} &= 30.12^\circ C
\end{align*}
\]
5.3.1.2 Junction Temperature Estimate

To estimate the internal junction temperature, the calculated temperature rise is added to the ambient or offset temperature. For this example, the worst-case junction temperature is estimated below:

\[ T_J = T_{\text{RISE}} + T_{\text{A(MAX)}} \]
\[ T_J = 30.12°C + 60.0°C \]
\[ T_J = 90.12°C \]

5.3.1.3 Maximum Package Power Dissipation at 60°C Ambient Temperature

TO-220-5 (29.3° C/W \( R_{\text{JA}} \)):
\[ P_{\text{D(MAX)}} = \frac{(125°C – 60°C)}{29.3°C/W} \]
\[ P_{\text{D(MAX)}} = 2.218W \]

DDPAK-5 (31.2°C/Watt \( R_{\text{JA}} \)):
\[ P_{\text{D(MAX)}} = \frac{(125°C – 60°C)}{31.2°C/W} \]
\[ P_{\text{D(MAX)}} = 2.083W \]

From this table, you can see the difference in maximum allowable power dissipation between the TO-220-5 package and the DDPAK-5 package.
6.0 PACKAGING INFORMATION

6.1 Package Marking Information

**Legend:**
- XX...X Customer-specific information
- Y Year code (last digit of calendar year)
- YY Year code (last 2 digits of calendar year)
- WW Week code (week of January 1 is week ‘01’)
- NNN Alphanumeric traceability code
- 3 Pb-free JEDEC designator for Matte Tin (Sn)

* This package is Pb-free. The Pb-free JEDEC designator (3) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

APPENDIX A:  REVISION HISTORY

Revision A (August 2007)

• Original Release of this Document.
## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

</table>

**Device:**
- MCP1826: 1000 mA Low Dropout Regulator
- MCP1826T: 1000 mA Low Dropout Regulator
- Tape and Reel
- MCP1826S: 1000 mA Low Dropout Regulator
- MCP1826ST: 1000 mA Low Dropout Regulator
- Tape and Reel

**Output Voltage:**
- 08 = 0.8V "Standard"
- 12 = 1.2V "Standard"
- 18 = 1.8V "Standard"
- 25 = 2.5V "Standard"
- 30 = 3.0V "Standard"
- 33 = 3.3V "Standard"
- 50 = 5.0V "Standard"
- ADJ = Adjustable Output Voltage ** (MCP1826 only)

*Contact factory for other output voltage options

**Tolerance:**
- 2 = 2.0% (Standard)

**Temperature:**
- E = -40°C to +125°C

**Extra Feature Code:**
- 0 = Fixed

**Package Type:**
- AB = Plastic Transistor Outline, TO-220, 3-lead
- AT = Plastic Transistor Outline, TO-220, 5-lead
- DB = Plastic Transistor Outline, SOT-223, 3-lead
- DC = Plastic Transistor Outline, SOT-223, 5-lead
- EB = Plastic, DDPAK, 3-lead
- ET = Plastic, DDPAK, 5-lead

**Note:** ADJ (Adjustable) only available in 5-lead version.

**Examples:**

XX = AB for 3LD TO-220 package
- AT for 5LD TO-220 package
- DB for 3LD SOT-223 package
- DC for 5LD SOT-223 package
- EB for 3LD DDPAK package
- ET for 5LD DDPAK package
Note the following details of the code protection feature on Microchip devices:

• Microchip products meet the specification contained in their particular Microchip Data Sheet.

• Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.

• There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

• Microchip is willing to work with the customer who is concerned about the integrity of their code.

• Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks
The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KEELoQ, KEELoQ logo, microID, MPLAB, PIC, PICmicro, PICSTART, PRO MATE, rPIC and SmartShunt are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AmpLab, FilterLab, Linear Active Thermistor, Migratable Memory, MXDEV, MXLAB, SEEVAL, SmartSensor and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, FlexROM, fuzzyLAB, In-Circuit Serial Programming, I CSP, ICEPIC, Mindi, MiWI, MPASM, MPLAB Certified logo, MPLIB, MPLINK, PICkit, PICDEM, PICDEM.net, PICLAB, PICtail, PowerCal, PowerInfo, PowerMate, PowerTool, REAL ICE, rLAB, Select Mode, Smart Serial, SmartTel, Total Endurance, UNI/O, WiperLock and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Printed on recycled paper.

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, K ezLo c® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
